

LG01N/OLG01N LoRa Gateway User Manual

Document Version: 1.2.1

Firmware Version: LG02_LG08—v5.1.15

Version	Description	Date
1.0	Release	2018-Dec-28
1.1	Add Customized Script Feature (firmware ver >LG02_LG08--build-v5.1.1547896817-20190119-1921)	2019-Jan-19
1.2	--Add Downlink support and example. (firmware ver >LG02_LG08--build-v5.1.1548820215-20190130-1151) --Correct typo for the UNO code of example for lg02_single_rx_tx	2019-Jan-30
1.2.1	-- Add OLG01 connector photo -- Add how to control LEDs -- Modify MQTT instruction	2019-Jun-19
1.2.2	--Add photo for OLG01 4G installation	2019-Nov-1
1.2.3	-- Change the HTTP Port and SSH port for firmware version > v5.3	2019-Nov-26

1. Introduction

1.1 What is LG01N & OLG01N

LG01N & OLG01N are an open source **single channel LoRa Gateway**. It lets you bridge LoRa wireless network to an IP network via WiFi, Ethernet, 3G or 4G cellular. The LoRa wireless allows users to send data and reach extremely long ranges at low data-rates. It provides ultra-long range spread spectrum communication and high interference immunity.

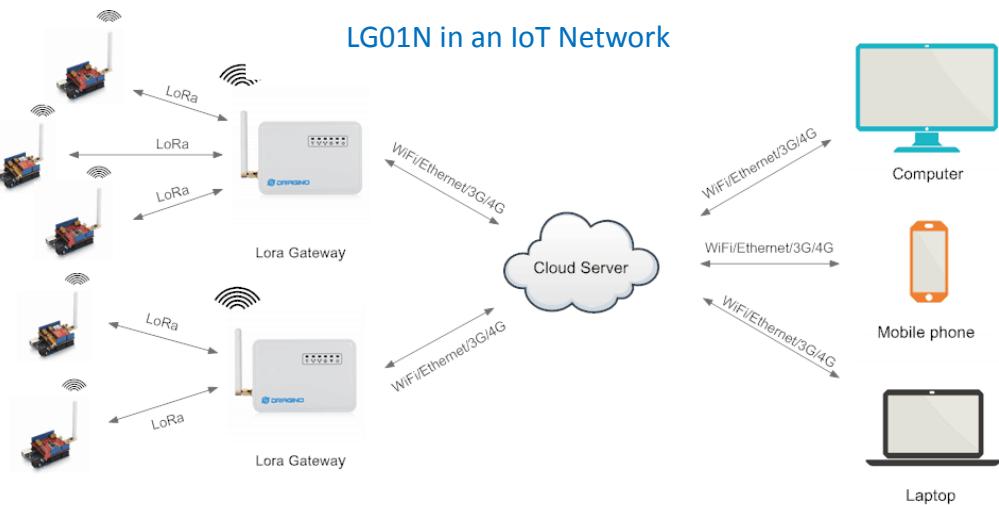

LG01N & OLG01N have rich internet connection method such as **WiFi interface, Ethernet port and 3G/4G Cellular**. These Interfaces provide flexible methods for users to connect their sensor networks to Internet.

LG01N & OLG01N can support the LoRaWAN protocol in single frequency and customized LoRa transition protocol.

LG01N can be used to provide a low cost IoT wireless solution to support 50~100 sensor nodes.

Except limited LoRaWAN mode, LG01N can support multiply working mode such as: **MQTT mode, TCP/IP Client mode** to fit different requirement for IoT connection.

LG01N & OLG01N provide a low cost for your IoT network connection. Compare to the cost with normal SX1301 LoRaWAN solution. LG01N & OLG01N is only of its 1/4 or less cost. This makes the LG01N very suitable to set up small scale LoRa network or use it to extend the coverage of current LoRaWAN network.

1.2 Specifications

Hardware System:

Linux Part:

- 400Mhz ar9331 processor
- 64MB RAM
- 16MB Flash

Interface:

- 10M/100M RJ45 Ports x 2
- WiFi : 802.11 b/g/n
- LoRa Wireless
- Power Input: 12V DC
- USB 2.0 host connector x 1
- USB 2.0 host internal interface x 1
- 1 x LoRa Interfaces

WiFi Spec:

- IEEE 802.11 b/g/n
- Frequency Band: 2.4 ~ 2.462GHz
- Tx power:
 - ✓ 11n tx power : mcs7/15: 11db mcs0 : 17db
 - ✓ 11b tx power: 18db
 - ✓ 11g 54M tx power: 12db
 - ✓ 11g 6M tx power: 18db
- Wifi Sensitivity
 - ✓ 11g 54M : -71dbm
 - ✓ 11n 20M : -67dbm

LoRa Spec:

- Frequency Range:
 - ✓ Band 1 (HF): 862 ~ 1020 Mhz
 - ✓ Band 2 (LF): 410 ~ 528 Mhz
- 168 dB maximum link budget.
- +20 dBm - 100 mW constant RF output vs.
- +14 dBm high efficiency PA.
- Programmable bit rate up to 300 kbps.
- High sensitivity: down to -148 dBm.
- Bullet-proof front end: IIP3 = -12.5 dBm.
- Excellent blocking immunity.
- Low RX current of 10.3 mA, 200 nA register retention.
- Fully integrated synthesizer with a resolution of 61 Hz.
- FSK, GFSK, MSK, GMSK, LoRaTM and OOK modulation.

-
- Built-in bit synchronizer for clock recovery.
 - Preamble detection.
 - 127 dB Dynamic Range RSSI.
 - Automatic RF Sense and CAD with ultra-fast AFC.
 - Packet engine up to 256 bytes with CRC.
 - Built-in temperature sensor and low battery indicator.

Cellular 4G LTE (optional):

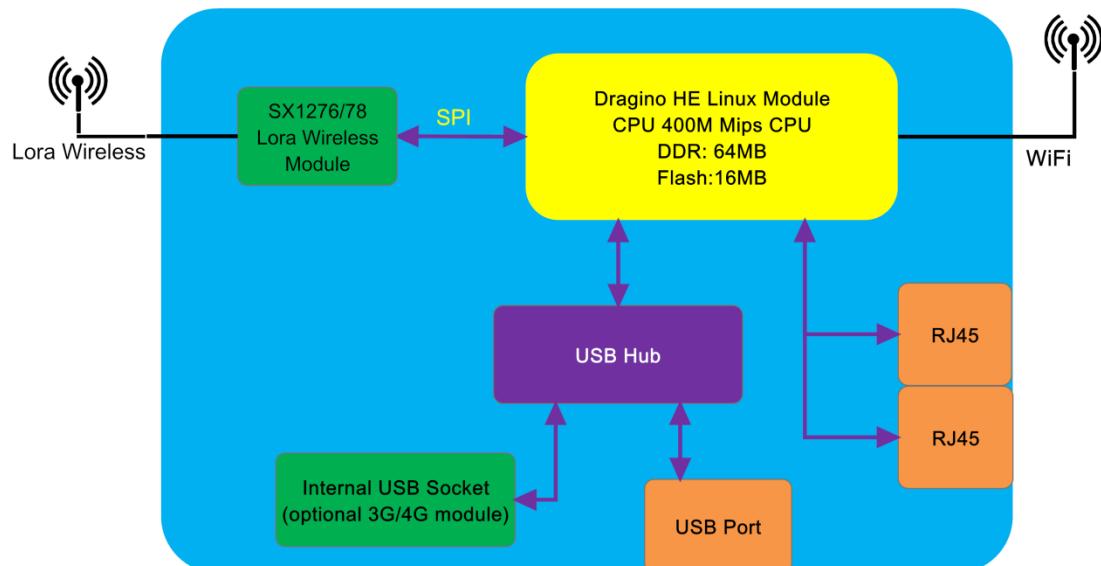

- Quectel [EC25 LTE module](#)
- Micro SIM Slot
- Internal 4G Antenna + External 4G Sticker Antenna.
- Up to 150Mbps downlink and 50Mbps uplink data rates
- Worldwide LTE, UMTS/HSPA+ and GSM/GPRS/EDGE coverage
- MIMO technology meets demands for data rate and link reliability in modem wireless communication systems

1.3 Features

- ✓ Open Source OpenWrt LEDE system
- ✓ Low power consumption
- ✓ Firmware upgrade via Web
- ✓ Software upgradable via network
- ✓ Flexible protocol to connect to IoT servers
- ✓ Auto-Provisioning
- ✓ Built-in web server
- ✓ Managed by Web GUI, SSH via LAN or WiFi
- ✓ Internet connection via LAN, WiFi, 3G or 4G
- ✓ Failsafe design provides robustly system
- ✓ 1 x SX1276/SX1278 LoRa modules
- ✓ Full – duplex LoRa transceiver
- ✓ Two receive channels, and one transmit channel
- ✓ Limited support in LoRaWAN/ Support Private LoRa protocol
- ✓ Support upto 100 nodes
- ✓ LoRa band available at 433/868/915/920 Mhz
- ✓ Max range in LoRa: 5~10 km. Density Area:>500m

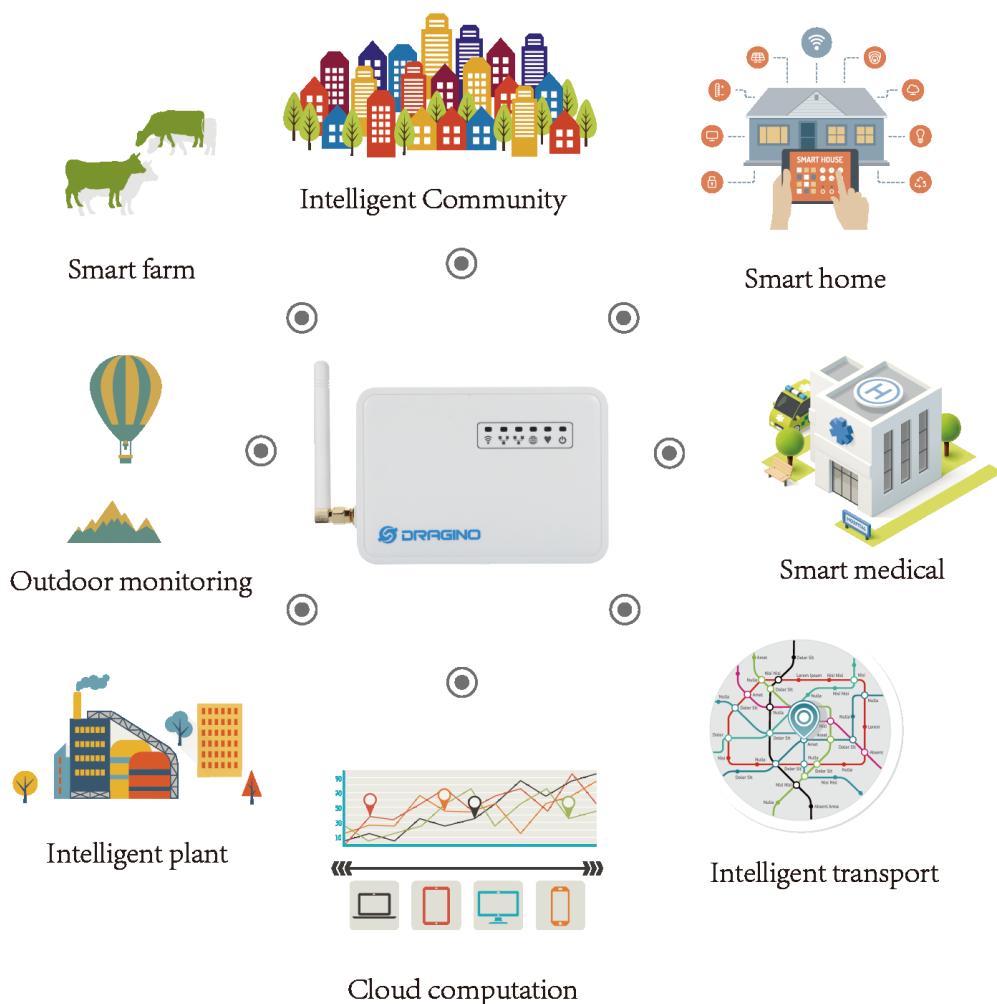

1.4 System Structure

LG01N System Overview:

1.5 Applications

Dragino Lora Gateway for IoT Applications

1.6 Hardware Variants

The LG01N and OLG01N use the same firmware and have the same feature in the software side. In this document, we will use LG01N as the model number to explain the feature.

Model	Photo	Description
LG01N		Indoor version for single channel LoRa Gateway,
OLG01N		Outdoor version for dual channel LoRa Gateway

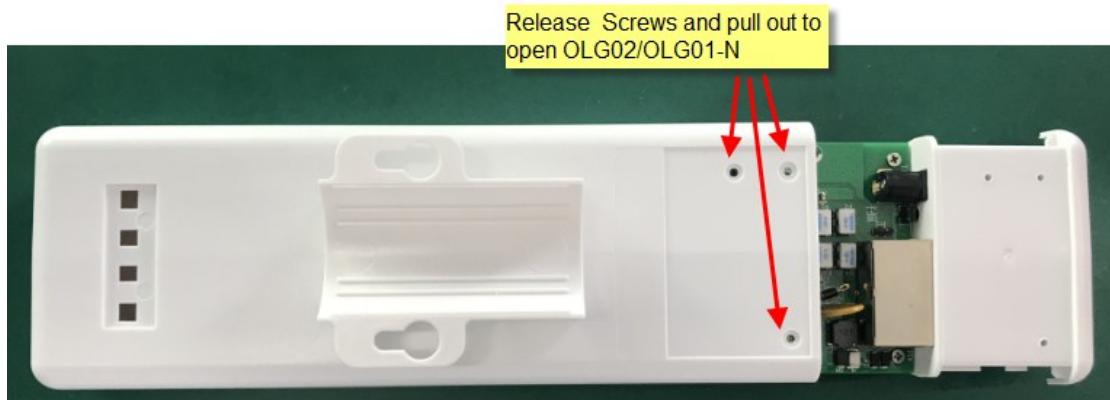

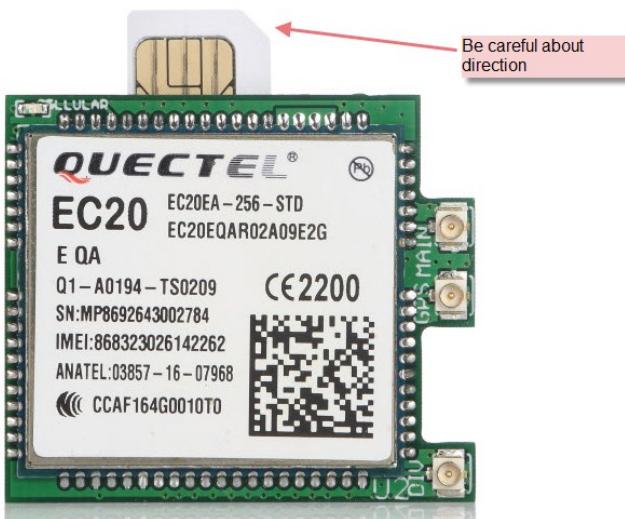

1.7 Interfaces

OLG01N Version Interface:

1.8 Install SIM card in 4G module

LG01N & OLG01N has optional built-in 4G module version. For the 4G version, devices will be shipped with screws un assembly, please open the box and use below direction to install the SIM card (Micro SIM)

1.9 Firmware Change log

Please see this link for firmware change log:

http://www.dragino.com/downloads/index.php?dir=LoRa_Gateway/LG02-OLG02/Firmware/&file=ChangeLog

2. Access LG01N

Access and configure LG01

The LG01N is configured as a WiFi AP by factory default. User can access and configure the LG01N after connect to its WiFi network.

At the first boot of LG01N, it will auto generate an unsecure WiFi network call dragino-xxxxxx

User can use the laptop to connect to this WiFi network. The laptop will get an IP address 10.130.1.xxx and the LG01 has the default IP 10.130.1.1

Open a browser in the laptop and type

<http://10.130.1.1/cgi-bin/luci/admin>

User will see the login interface of LG01N.

The account for Web Login is:

User Name: root

Password: dragino

Note: the LG01 can also be accessed via WAN interface (WAN port or WiFi when device acts as WiFi Client). But for security reason, for firmware version >5.3, the http access on WAN interface has been set to 8000, SSH access has been set to 2222.

dragino-168cb0 - LuCI x

10.130.1.1/cgi-bin/luci/admin

dragino-168cb0

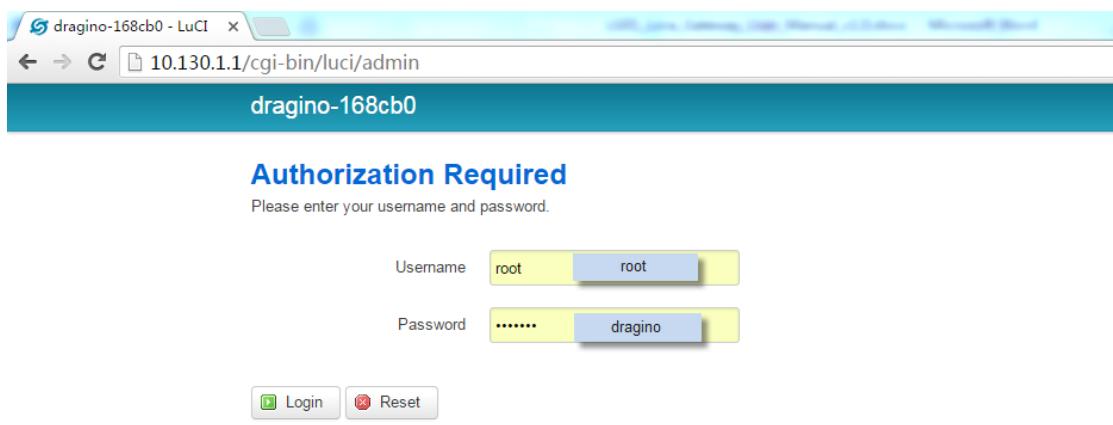

Authorization Required

Please enter your username and password.

Username

Password

DRAGINO TECHNOLOGY CO., LIMITED

Notice: In case the WiFi network is disabled, user can connect the PC to LG01N's LAN port, the PC will get DHCP from LG01N, and be able to access it.

3. Typical Network Setup

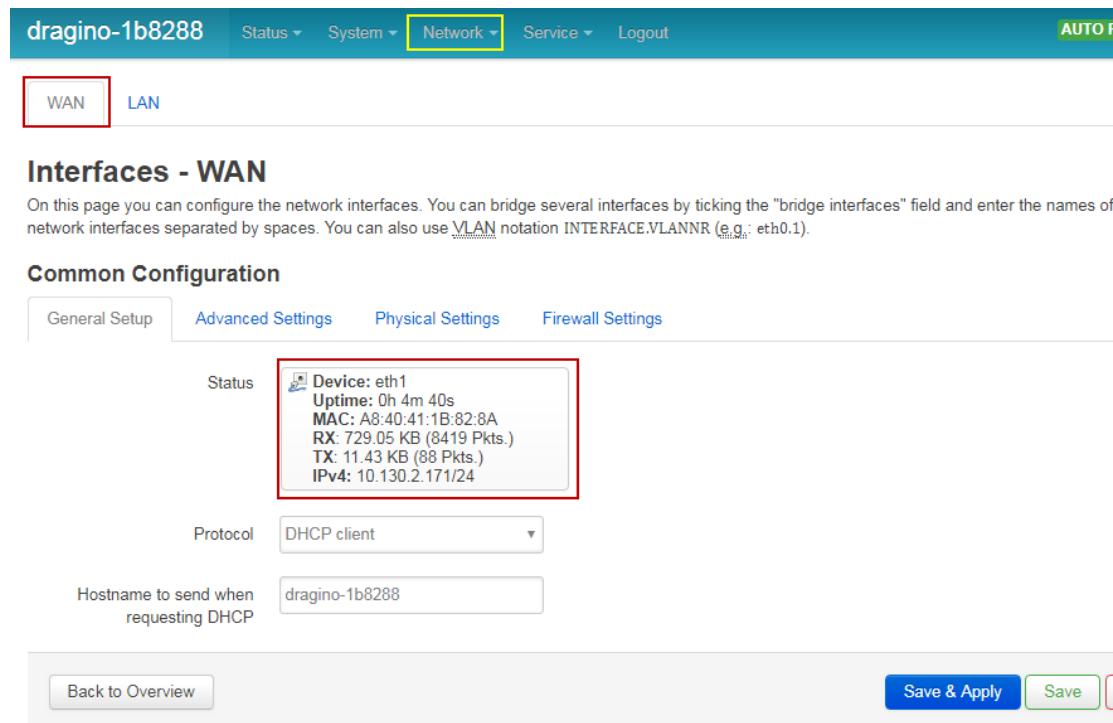

3.1 Overview

LG01N supports flexible network set up for different environment. This section describes the typical network topology can be set in LG01N. The typical network set up includes:

- ✓ **WAN Port Internet Mode**
- ✓ **WiFi Client Mode**
- ✓ **WiFi AP Mode**
- ✓ **USB Dial Up Mode**

3.2 Use WAN port to access Internet

By default, the LG01N set to use WAN port as network connection. When connect LG01N's WAN port to router, LG01N will get IP from router and have internet access. The network status is as below:

The screenshot shows the DRAGINO web interface with the following details:

- Header:** dragino-1b8288, Status ▾, System ▾, **Network ▾** (highlighted), Service ▾, Logout, AUTO R
- Navigation:** WAN (highlighted with a red box), LAN
- Section:** Interfaces - WAN
- Description:** On this page you can configure the network interfaces. You can bridge several interfaces by ticking the "bridge interfaces" field and enter the names of network interfaces separated by spaces. You can also use VLAN notation INTERFACE.VLANNR (e.g.: eth0.1).
- Common Configuration:**
 - General Setup** (selected)
 - Advanced Settings**
 - Physical Settings**
 - Firewall Settings**
- Status:** Device: eth1, Uptime: 0h 4m 40s, MAC: A8:40:41:1B:82:8A, RX: 729.05 KB (8419 Pkts.), TX: 11.43 KB (88 Pkts.), IPv4: 10.130.2.171/24
- Protocol:** DHCP client
- Hostname to send when requesting DHCP:** dragino-1b8288
- Buttons:** Back to Overview, Save & Apply, Save (highlighted with a red box)

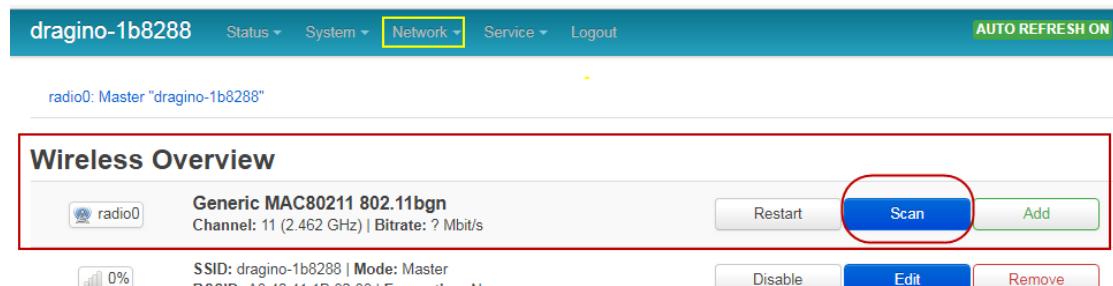

3.3 Access Internet as a WiFi Client.

In the WiFi Client Mode, Dragino acts as a WiFi client and gets IP from uplink router via WiFi.

The step to set is as below:

Step1:

In network -> Wireless, select Radio0 interface and scan.

dragino-1b8288 Status ▾ System ▾ Network **Network** Service ▾ Logout AUTO REFRESH ON

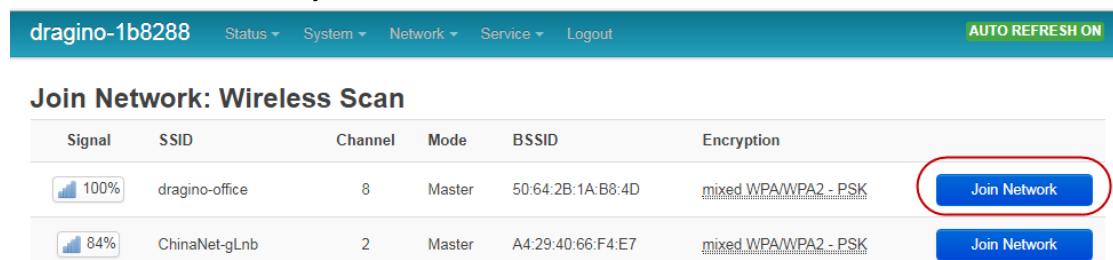

radio0: Master "dragino-1b8288"

Wireless Overview

	radio0	Generic MAC80211 802.11bgn Channel: 11 (2.462 GHz) Bitrate: ? Mbit/s	Restart	Scan	Add
	0%	SSID: dragino-1b8288 Mode: Master BSSID: A8:40:41:1B:82:88 Encryption: None	Disable	Edit	Remove

Step2:

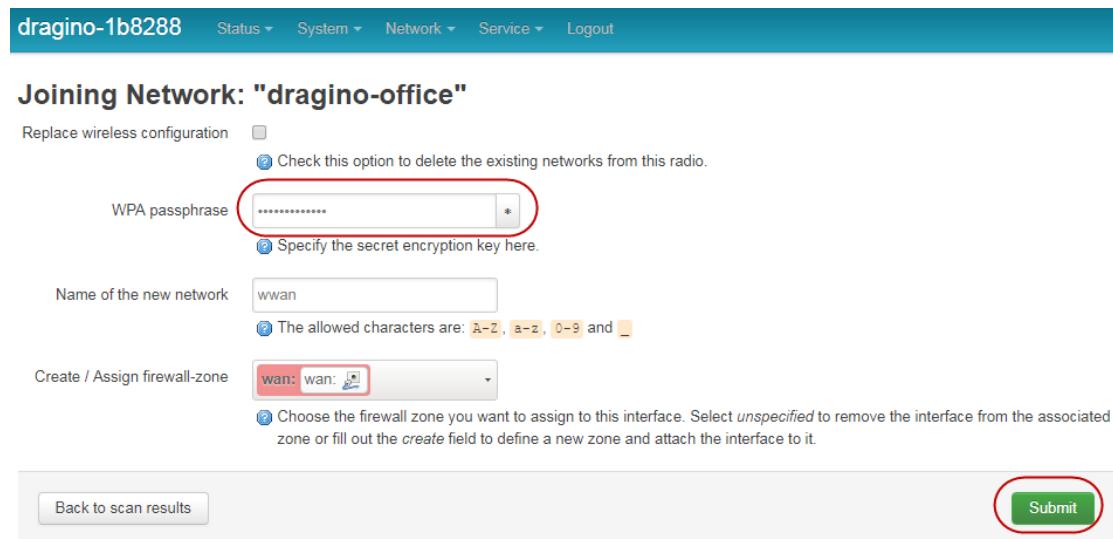

Select the wireless AP and join:

dragino-1b8288 Status ▾ System ▾ Network **Network** Service ▾ Logout AUTO REFRESH ON

Join Network: Wireless Scan

Signal	SSID	Channel	Mode	BSSID	Encryption
	dragino-office	8	Master	50:64:2B:1A:B8:4D	mixed WPA/WPA2 - PSK
	ChinaNet-gLnB	2	Master	A4:29:40:66:F4:E7	mixed WPA/WPA2 - PSK

dragino-1b8288 Status ▾ System ▾ Network **Network** Service ▾ Logout

Joining Network: "dragino-office"

Replace wireless configuration

Check this option to delete the existing networks from this radio.

WPA passphrase *

Specify the secret encryption key here.

Name of the new network

The allowed characters are: **A-Z**, **a-z**, **0-9** and **_**

Create / Assign firewall-zone

Choose the firewall zone you want to assign to this interface. Select *unspecified* to remove the interface from the associated zone or fill out the *create* field to define a new zone and attach the interface to it.

Back to scan results **Submit**

Step3:

In network->wireless page, disable WiFi AP network. Notice: After doing that, you will lose connection if your computer connects to the LG01N via LG01N's wifi network.

radio0: Master "dragino-1b8288"

Wireless Overview

```

4. Example 1: Configure as a LoRaWAN gateway – Limited LoRaWAN mode

LoRaWAN mode:

Use LG01N / OLG01N as a [LoRaWAN gateway*](#) to forward packet to LoRaWAN IoT Server

Operate Principle:

- LG01N/OLG01N running packet forward and will forward the uplink LoRa packet from end node to LoRaWAN server.
- It will also forward downlink LoRa packet from LoRaWAN server to end node.
- The end node can use OTAA or ABP mode in the LoRaWAN protocol.

Limitation:

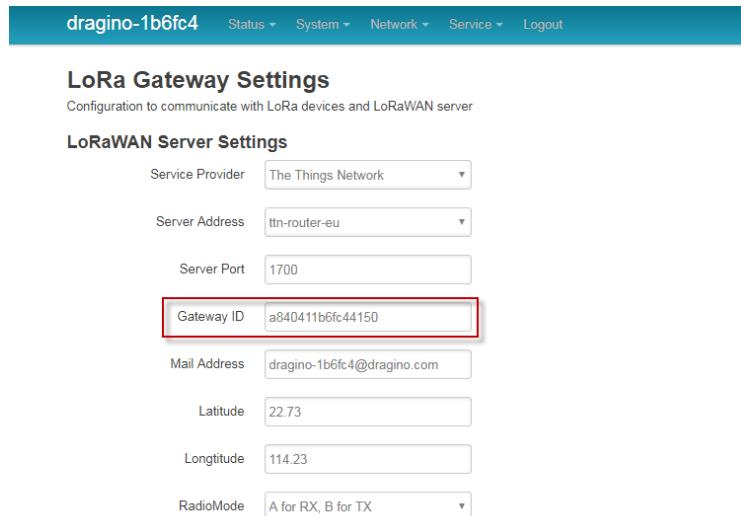

- The LG01 only support one LoRaWAN frequency for uplink. So the end node should be set to fix frequency.
- If end node use multiply frequencies to transfer, The LG01 will only be able to receive the same frequency set in LG01N.

This chapter describes how to use LG01N to work with [TTN LoRaWAN Server](#). The method to work with other LoRaWAN Server is similar.

4.1 Create a gateway in TTN Server

Step 1: Get a Unique gateway ID.

Every LG01N has a unique gateway id. The id can be found at LoRaWAN page:

dragino-1b6fc4 Status System Network Service Logout

LoRa Gateway Settings
Configuration to communicate with LoRa devices and LoRaWAN server

LoRaWAN Server Settings

Service Provider	The Things Network
Server Address	ttn-router-eu
Server Port	1700
Gateway ID	a840411b6fc44150
Mail Address	dragino-1b6fc4@dragino.com
Latitude	22.73
Longitude	114.23
RadioMode	A for RX, B for TX

The gateway id is: **a840411b6fc44150**

Step 2: Sign up an user account in TTN server

Step 3: Create a Gateway in TTN

The Things Network Console - COMMUNITY EDITION

Welcome to The Things Network Console. This is where the magic happens. Here you can work with your data. Register applications, devices and gateways, manage your integrations, collaborators and settings.

ttn-router-eu

After create the gateway, we can see the gateway info, as below, the **Status** shows “not connected” because the LG01N doesn’t configure to send update status yet.

The screenshot shows the 'GATEWAY OVERVIEW' section of the DRAGINO web interface. Key details include:

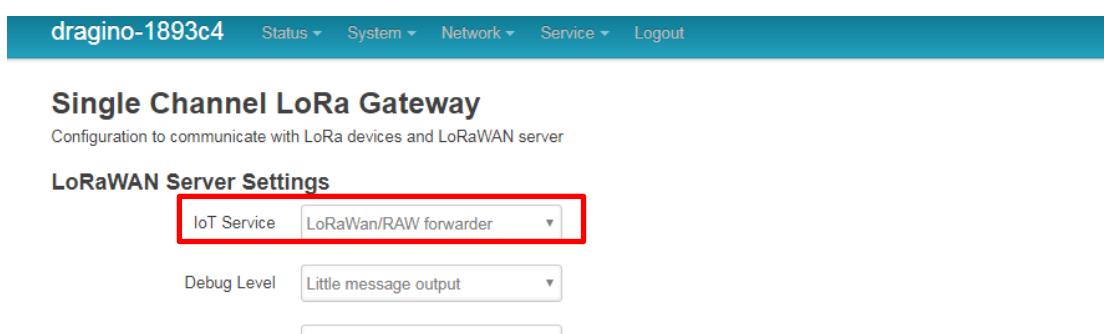

- Gateway ID: eui-a840411b
- Description: LG02-Gateway-1
- Owner: edwin (with a transfer ownership link)
- Status: not connected (highlighted with a red box)
- Frequency Plan: Europe 868MHz
- Router: ttn-router-eu
- Gateway Key: A long string of characters with a copy/paste icon and base64 link.

4.2 Configure LG01N Gateway

4.2.1 Configure to connect to LoRaWAN server

We should configure the LG01N now to let it connect to TTN network. Make sure your LG01N has Internet Connection first.

Step1: Configure LG01N to act as raw forwarder mode

The screenshot shows the 'Single Channel LoRa Gateway' configuration page. Under 'LoRaWAN Server Settings', the 'IoT Service' dropdown is set to 'LoRaWan/Raw forwarder' (highlighted with a red box). Other settings include 'Debug Level: Little message output'.

Step2: Input server info and gateway id

Choose the correct the server address and gateway ID.

dragino-1b8288

4.2.2 Configure LG01's Radio frequency

Now we should configure LG01N's radio parameter to receive the LoRaWAN packets. we configure is to use 868.1Mhz (868100000 Hz) as below.

Radio Settings

Radio settings for Channel

Frequency (Unit:Hz)	868100000
Spreading Factor	SF7
Coding Rate	4/5
Signal Bandwidth	125 kHz
Preamble Length	8 <small>Length range: 6 ~ 65536</small>
LoRa Sync Word	52 <small>Value 52(0x34) for LoRaWAN</small>
Encryption Key	Encryption Key

4.3 Create LoRa End Node

4.3.1 About Limited support for LoRaWAN

LG01N supports LoRaWAN End Node, in LoRaWAN protocol, it requires LoRaWAN node to send data in a hopping frequency. Since LG01N only support one single frequency, it will only be able to receive the packet which is of the same radio parameters in LG01N.

For example, in EU868, a standard LoRaWAN device may send the data in eight frequencies with different Frequency & SF, such as:

```
LMIC_setupChannel(0, 868100000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(1, 868300000, DR_RANGE_MAP(DR_SF12, DR_SF7B), BAND_CENTI); // g-band
LMIC_setupChannel(2, 868500000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(3, 867100000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(4, 867300000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(5, 867500000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(6, 867700000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(7, 867900000, DR_RANGE_MAP(DR_SF12, DR_SF7), BAND_CENTI); // g-band
LMIC_setupChannel(8, 868800000, DR_RANGE_MAP(DR_FSK, DR_FSK), BAND_MILLI); // g2-band
```

So the LG01N will only able to receive the 868100000, SF7 packet and will not receive others.

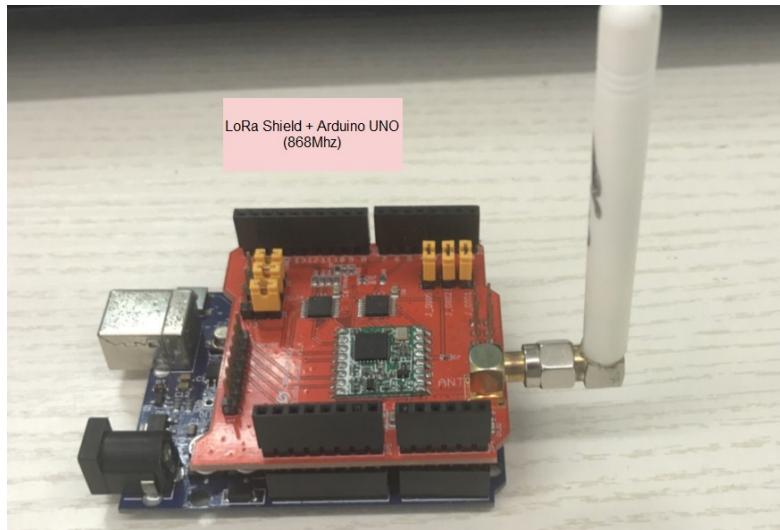

Means only one packet will arrive the TTN server in every 8 packet sent from the LoRaWAN end node.

If user want all the packets from LoRaWAN end device can arrive LoRaWAN server, user need to set up the LoRaWAN node to send packet in a single frequency.

In this section, we will use LoRa Shield and a modify LMIC Library to show how to configure LoRaWAN end node and work in single frequency.

4.3.2 Preparation

LoRaWAN End device Hardware:

Software Library for LoRaWAN End device:

Install this library <https://github.com/dragino/arduino-lmic> to the Arduino Library path. Before compiling the End Device software, User needs to change the Frequency Band to use with LG02.

What user need to change is in the file **arduino\libraries\arduino-lmic\src\lmic\config.h**.

Changes are as below:

```
#define CFG_eu868 1
//#define CFG_us915 1
//#define CFG_au921 1
//#define CFG_as923 1
//#define CFG_in866 1

#define LG02_LG01 1

//US915: DR_SF10=0, DR_SF9=1, DR_SF8=2, DR_SF7=3, DR_SF8C=4
//          DR_SF12CR=8, DR_SF11CR=9, DR_SF10CR=10, DR_SF9CR=11, DR_SF8CR=12, DR_SF7CR
#ifndef defined(CFG_us915) && defined(LG02_LG01)
  #define LG02_UPFREQ 902320000
  #define LG02_DNWREQ 923300000
  #define LG02_RXSF 3 // DR_SF7
  #define LG02_TXSF 8 // DR_SF12CR
  #elif defined(CFG_eu868) && defined(LG02_LG01)
    #define LG02_UPFREQ 868100000
    #define LG02_DNWREQ 869525000
    #define LG02_RXSF 5 // DR_SF7
    #define LG02_TXSF 0 // DR_SF12
#endif

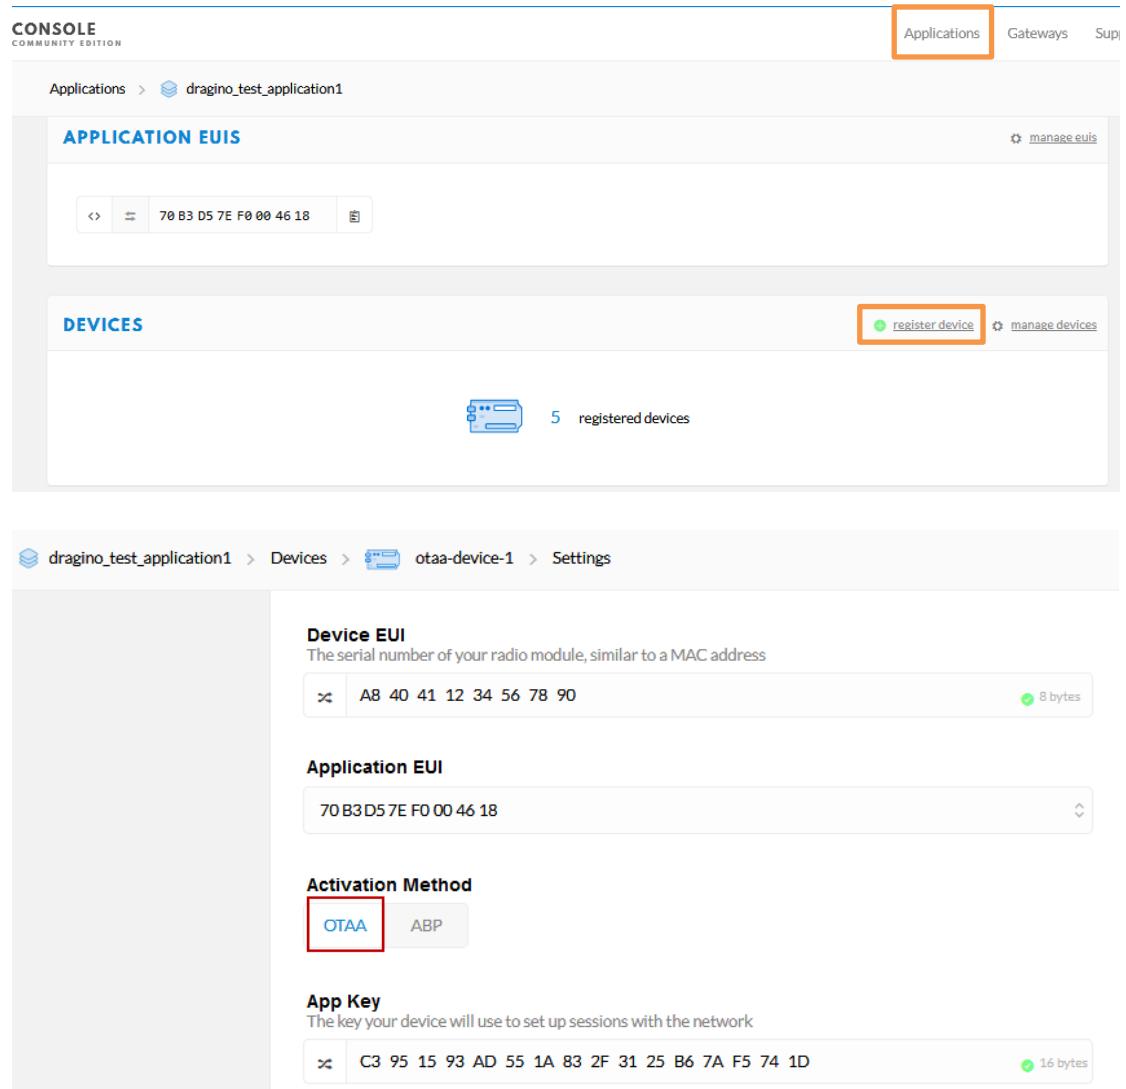

Choose the Frequency Band, same as in
LoRaWAN server

uncomment this for LG01 / LG02

The TXSF is now set to default value:
US915/AS923 : 923300000 , SF12BW500
EU868: 869525000, SF12BW125
```

4.3.3 Test with OTAA LoRa end node (LoRa Shield + UNO)

Step 1: Create an OTAA device in TTN server -- > Application page.

The screenshot shows the DRAGINO Console Application page. At the top, there are tabs for CONSOLE, Applications (which is selected and highlighted with an orange border), Gateways, and Support. Below the tabs, the URL is shown as Applications > dragino_test_application1. The main area is divided into two sections: APPLICATION EUIS and DEVICES.

APPLICATION EUIS: Shows a single EUI entry: 70 B3 D5 7E F0 00 46 18. There is a link to manage_euis.

DEVICES: Shows 5 registered devices. There is a link to register a new device (highlighted with an orange border) and another link to manage devices.

Below these sections, the breadcrumb navigation shows: dragino_test_application1 > Devices > otaa-device-1 > Settings. The main content area displays the configuration for the device "otaa-device-1".

Device EUI: The serial number of the radio module, similar to a MAC address. Value: A8 40 41 12 34 56 78 90 (8 bytes).

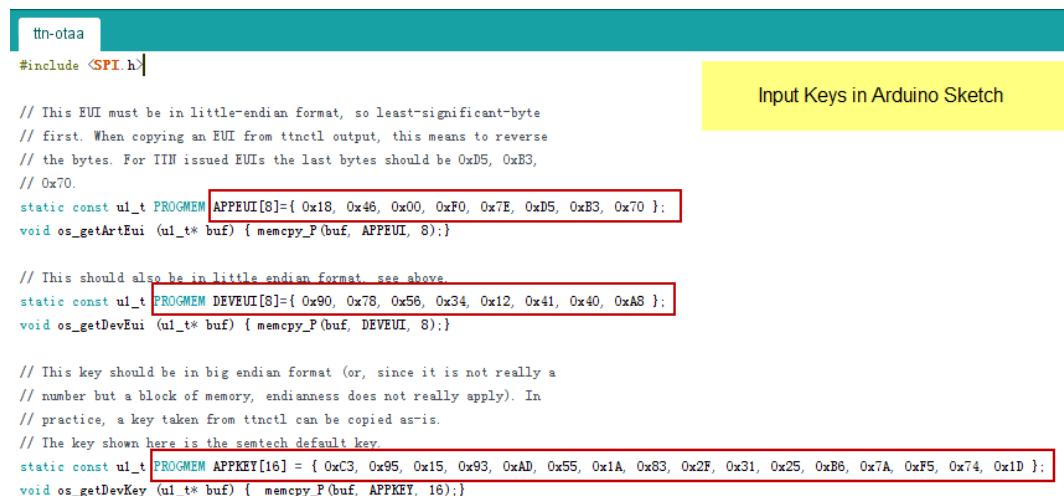

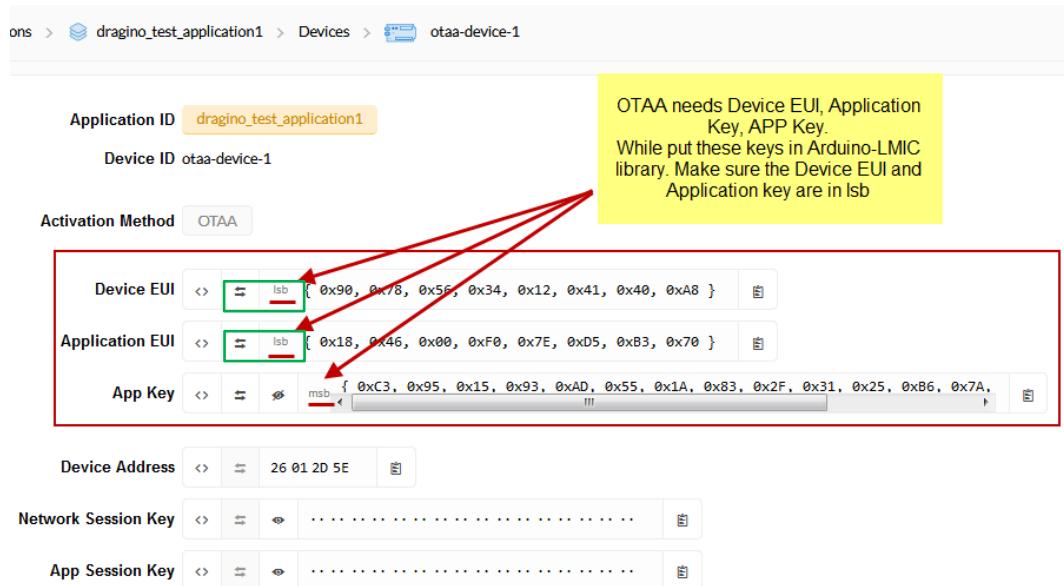

Application EUI: Value: 70 B3 D5 7E F0 00 46 18.

Activation Method: Options are OTAA (selected and highlighted with a red box) and ABP.

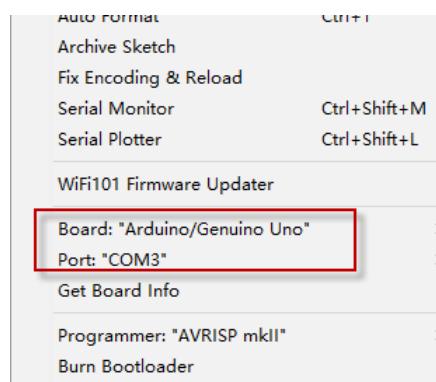

App Key: The key your device will use to set up sessions with the network. Value: C3 95 15 93 AD 55 1A 83 2F 31 25 B6 7A F5 74 1D (16 bytes).

Step 2: Input keys into Arduino Sketch.

The sketch for the LoRa Shield is in Arduino -IDE --> Examples -->LMIC_Arduino→ ttn-otaa

Choose Arduino UNO to upload the sketch to LoRa Shield and UNO

Step 3: Check Result for OTAA

COM9

End Device Log

```

4.3.4 Test with ABP LoRa end node (LoRa Shield + UNO)

Step 1: Create an ABP device in TTN server --> Application page. And change it to ABP mode.

The screenshot shows the DRAGINO Console interface. At the top, there are tabs for Applications, Gateways, and Supl. The Applications tab is selected and highlighted with an orange border. Below the tabs, the path 'Applications > dragino_test_application1' is shown. The main area has two sections: 'APPLICATION EUIS' and 'DEVICES'. The 'APPLICATION EUIS' section shows a single EUI: 70 B3 D5 7E F0 00 46 18. The 'DEVICES' section shows 5 registered devices, with a 'register device' button highlighted with an orange border. In the bottom navigation bar, the 'Settings' tab is selected and highlighted with an orange border. The path 'Applications > dragino_test_application1 > Devices > edwintest1 > Settings' is shown. The 'DEVICE SETTINGS' tab is selected and highlighted with an orange border. Under 'SETTINGS', there are fields for 'Description' (a human-readable description of the device), 'Device EUI' (The serial number of your radio module, similar to a MAC address, with value 00 BA DE A0 36 70 68 72), 'Application EUI' (70 B3 D5 7E F0 00 46 18), and 'Activation Method' (with options OTAA and ABP, where ABP is highlighted with an orange border).

Step 2: Input keys into Arduino Sketch.

The sketch for the LoRa Shield is in Arduino –IDE --> Examples -->LMIC_Arduino→ttn-abp

Applications > dragino_test_application1 > Devices > edwintest1

TTN LoRaWAN End Device page

Application ID **dragino_test_application1**

Device ID **edwintest1**

Activation Method **ABP**

Device EUI **00 BA DE A0 36 70 68 72**

Application EUI **70 B3 D5 7E F0 00 46 18**

Device Address **26 01 1C 22**

Network Session Key **{ 0x9A, 0xEA, 0xD0, 0x93, 0x06, 0xE3, 0x2B, 0x73, 0xDD, 0x54, 0x7B, 0x8B, 0xFF, 0xB6, 0x07, 0x5B, 0xB5, 0xE4, 0xCE, 0x40, 0xA2, 0xA3, 0xEE, 0x7B, 0xDF, 0xDC, 0x20, 0xF9 }**

App Session Key **{ 0xB6, 0x07, 0x5B, 0xB5, 0xE4, 0xCE, 0x40, 0xA2, 0xA3, 0xEE, 0x7B, 0xDF, 0xDC, 0x23, 0x0E, 0x2B }**

Make sure the Network Session Key and App Session Key are in MSB order

ttn-abp

Arduino Sketch ttn-abp

```
#include <lmic.h>
#include <hal/hal.h>
#include <SPI.h>

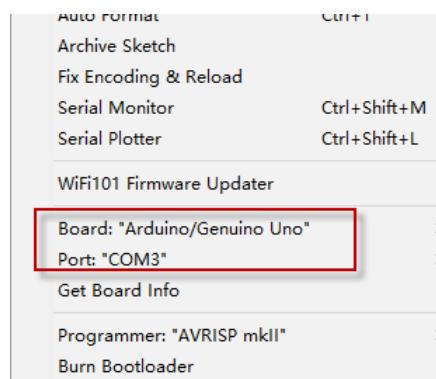

// LoRaWAN NwkSKey, network session key
// This is the default Semtech key, which is used by the early prototype TTN
// network.
static const PROGMEM u1_t NWKSKEY[16] = { 0x9A, 0xEA, 0xD0, 0x93, 0x06, 0xE3, 0x2B, 0x73, 0xDD, 0x54, 0x7B, 0x8B, 0xFF, 0xB6, 0x07, 0x5B, 0xB5, 0xE4, 0xCE, 0x40, 0xA2, 0xA3, 0xEE, 0x7B, 0xDF, 0xDC, 0x20, 0xF9 };

// LoRaWAN AppSKey, application session key
// This is the default Semtech key, which is used by the early prototype TTN
// network.
static const u1_t PROGMEM APPSKEY[16] = { 0xB6, 0x07, 0x5B, 0xB5, 0xE4, 0xCE, 0x40, 0xA2, 0xA3, 0xEE, 0x7B, 0xDF, 0xDC, 0x23, 0x0E, 0x2B };

// LoRaWAN end-device address (DevAddr)
static const u4_t DEVADDR = 0x26011C22; //-- Change this address for every node!
```

Input the keys from TTN

Choose Arduino UNO to upload the sketch to LoRa Shield and UNO

Step 3: Check Result for Uplink

Packet Sent From LoRa Shield.
In Arduino IDE --> Serial Monitor

```

5. Example 2: Manually send / receive LoRa packets

There are two ways to use the LoRa Radio of Gateway: a) Through pkt_fwd process , b) Use the Radio separately.

5.1 User LoRa Radio via pkt_fwd

5.1.1 Use pkt_fwd to receive

When user chooses the MQTT/TCP-IP/Customized mode, the lg01_pkt_fwd will auto start. It will listen the LoRa Radio Channel base on the setting in the web setting.

Radio Settings

Radio settings for Channel

Frequency (Unit:Hz)	915000000
Spreading Factor	SF7
Coding Rate	4/5
Signal Bandwidth	125 kHz
Preamble Length	8 <small>Length range: 6 ~ 65536</small>
LoRa Sync Word	52

If the LoRa end node send data in the match format, the pkt_fwd will store the data for further use, the logic of this receive part please see [Customized Script](#).

5.1.2 Use pkt_fwd to transmit

(This is a new feature since 2019-Jan-30)

The pkt_fwd also open a thread to listen to local files under directory **/var/iot/push/**. Once there is a file in this directory, the thread will check if it is an outgoing file and send out the LoRa message if format match. Below is the file example (json format):

```
{"txpk":{"imme":false,"tmst":861608339,"freq":925.1,"rfch":0,"powe":20,"modu":"LORA","datr":"SF7BW500","codr":"4/5","ipol":true,"size":22,"ncrc":true,"data":"YEkIBCaqCgADQAIAcQM6AP8B9TYzUA=="}}
```

Explain:

Name | Type | Function

-----|-----|-----

imme | bool | Send packet immediately (will ignore tmst & time)

tmst | number | Send packet on a certain timestamp value (will ignore time)

tmms | number | Send packet at a certain GPS time (GPS synchronization required)

freq | number | TX central frequency in MHz (unsigned float, Hz precision)

rfch | number | Concentrator "RF chain" used for TX (unsigned integer)

powe | number | TX output power in dBm (unsigned integer, dBm precision)

modu | string | Modulation identifier "LORA" or "FSK"

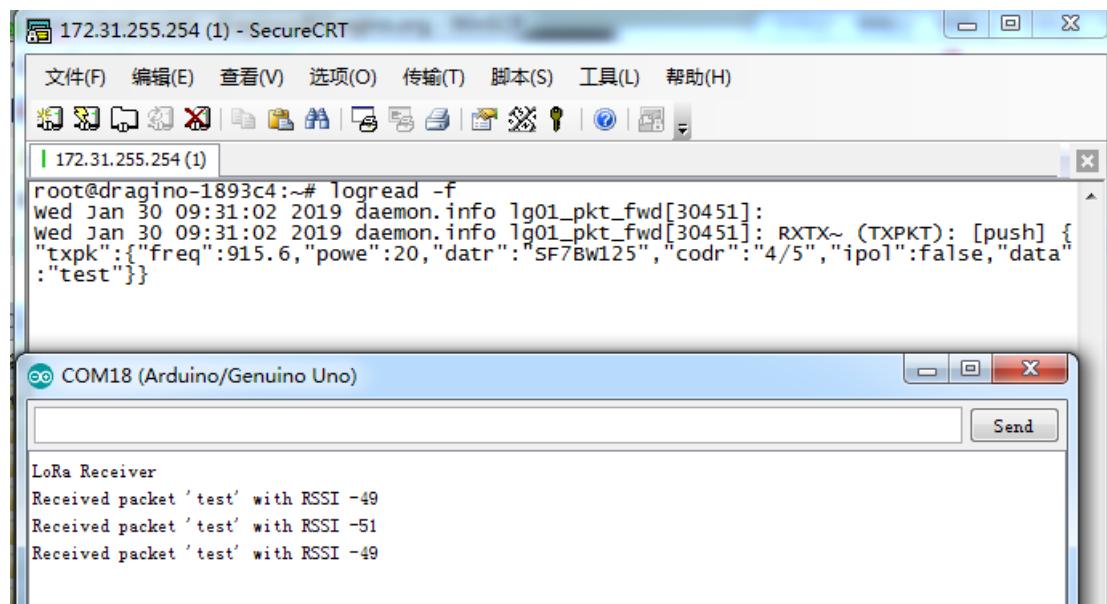

datr | string | LoRa datarate identifier (eg. SF12BW500)

datr | number | FSK datarate (unsigned, in bits per second)
codr | string | LoRa ECC coding rate identifier
fdev | number | FSK frequency deviation (unsigned integer, in Hz)
ipol | bool | Lora modulation polarization inversion
prea | number | RF preamble size (unsigned integer)
size | number | RF packet payload size in bytes (unsigned integer)
data | string | Base64 encoded RF packet payload, padding optional
ncrc | bool | If true, disable the CRC of the physical layer (optional)

Not all fields are necessary, below is an example:

- 1) First set up a LoRa Shield with this code: [LoRaReceiver](#). So the LoRa Shield will receive the data at frequency 915.6Mhz, SF7BW125, CR: 4/5
- 2) Edit a file (any name) under **/var/iot/push/** with below content.
{"txpk": {"freq":915.6,"powe":20,"datr":"SF7BW125","codr":"4/5","ipol":false,"data":"test"}}

And then we can see below output

SecureCRT window (172.31.255.254 (1) - SecureCRT):

```
root@dragino-1893c4:~# logread -f
Wed Jan 30 09:31:02 2019 daemon.info lg01_pkt_fwd[30451]:
Wed Jan 30 09:31:02 2019 daemon.info lg01_pkt_fwd[30451]: RXTX~ (TXPKT): [push] {
"txpk": {"freq":915.6,"powe":20,"datr":"SF7BW125","codr":"4/5","ipol":false,"data":"test"}}

```

Arduino Serial Monitor (COM18 (Arduino/Genuino Uno)):

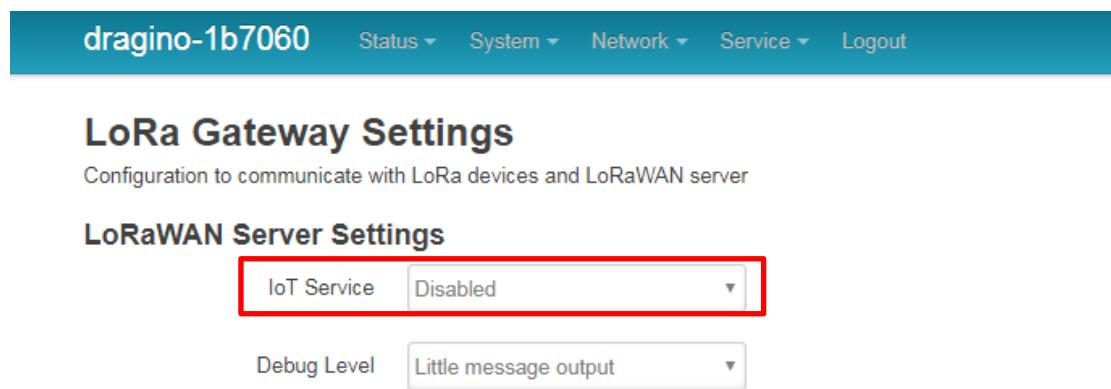

```
LoRa Receiver
Received packet 'test' with RSSI -49
Received packet 'test' with RSSI -51
Received packet 'test' with RSSI -49
```

5.2 Use LoRa radio device directly

The LoRa Radio of LG01N is a SPI device, user can use lg02_single_rx_tx to control this SPI device for transmit and receive. When use the lg02_single_rx_tx command to transmit, it will initiate the SPI device on each call and it will add delay to start transmit, it is will be slower than above method (via pkg_fwd)

Step 1: Disable packet forward

With firmware higher than version LG02_LG08--build-v5.1.1545908833-20181227-1908, select "Disabled" in IoT Service page.

The screenshot shows the LoRa Gateway Settings page. At the top, there is a navigation bar with the text "dragino-1b7060" and dropdown menus for Status, System, Network, Service, and Logout. Below the navigation bar, the title "LoRa Gateway Settings" is displayed, followed by the subtitle "Configuration to communicate with LoRa devices and LoRaWAN server". Under the subtitle, there is a section titled "LoRaWAN Server Settings" with two dropdown menus. The first dropdown is labeled "IoT Service" and has the value "Disabled" selected. The second dropdown is labeled "Debug Level" and has the value "Little message output" selected. Both dropdowns are highlighted with a red border.

Step 2: Use lg02_single_rx_tx to receive, for LG01N, the option [-d] is 2

Usage: lg02_single_rx_tx [-d radio_dev] select radio 1 or 2 (default:1)

- [-t] set as tx
- [-r] set as rx
- [-f frequency] (default:868500000)
- [-s spreadingFactor] (default: 7)
- [-b bandwidth] default: 125k
- [-w syncword] default: 52(0x34)reserver for lorawan
- [-m message] message to send
- [-o filepath] payload output to file
- [-v] show version
- [-h] show this help and exit Use Radio 1 to transmit:

Command:

```
root@dragino-1b6fb0:~# lg02_single_rx_tx -r -d 2 -f 915600000
```

Set up the radio as receiver at frequency 915600000,SF7BW125,SyncWord:0x34

DRAGINO www.dragino.com

172.31.255.254 - SecureCRT

文件(F) 编辑(E) 查看(V) 选项(O) 传输(T) 脚本(S) 工具(L) 帮助(H)

172.31.255.254

```
root@dragino-1b6fb0:~# lg02_single_rx_tx -r -d 1 -f 915600000
Radio struct: spi_dev=/dev/spidev1.0, spiport=3, freq=915600000, sf=7, bw=125000, cr=
5, wd=0x34
INFO~ RFDEV: SX1276 detected, starting.
```

Then set up a LoRa node to send out LoRa packet, we use [LoRa Shield](#) + UNO in this example. The library use in Arduino UNO is [LoRa-Master](#). And the source code is [LoRaSender](#).

Result screen shot:

COM9

RXTX~ Receive(HEX):68656c6c6f203137
echo received: hello 17

RXTX~ Receive(HEX):68656c6c6f203138
```

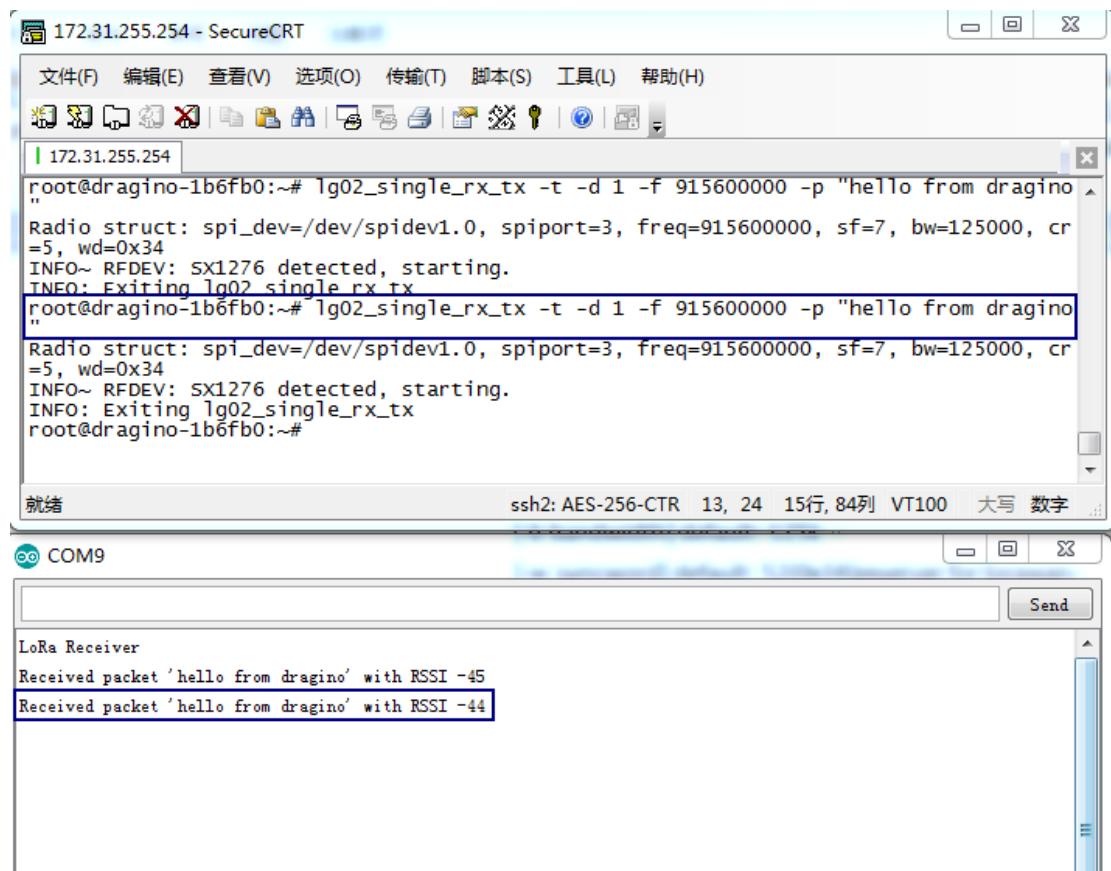

Step 3: Use lg02_single_rx_tx to transmit

Command:

```
root@dragino-1b6fb0:~# lg02_single_rx_tx -t -d 2 -f 915600000 -m "hello from dragino"
```

Set up radio to transmit a message at frequency 915600000

Set up a LoRa node to send out LoRa packet, we use [LoRa Shield](#) + UNO in this example. The library use in Arduino UNO is [LoRa-Master](#). And the source code is [LoRaReceiver](#).

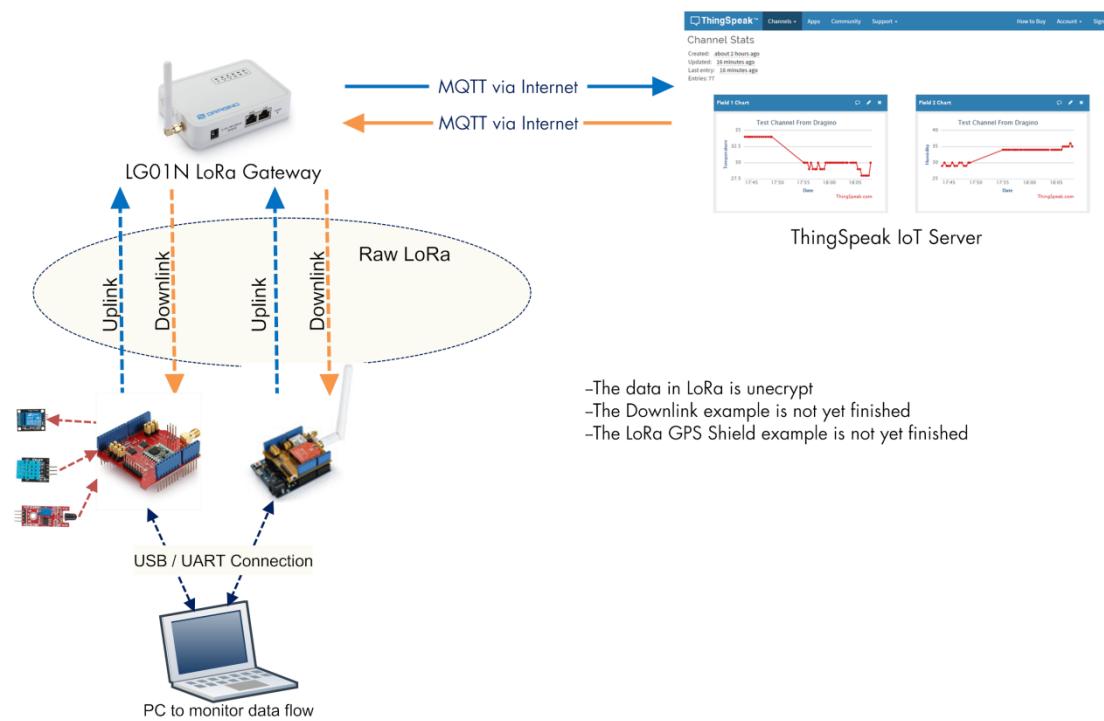

6. Example 3: MQTT Transfer Mode

MQTT is a machine-to-machine (M2M)/"Internet of Things" connectivity protocol. It was designed as an extremely lightweight publish/subscribe messaging transport. It is useful for connections with remote locations where a small code footprint is required and/or network bandwidth is at a premium. For example, it has been used in sensors communicating to a broker via satellite link, over occasional dial-up connections with healthcare providers, and in a range of home automation and small device scenarios.

Most IoT server support MQTT connection, for those servers, we can use MQTT to connect it to publish data or subscribe to a channel.

Topology for ThingSpeak Connection:

Most IoT server support MQTT connection, for those servers, we can use MQTT to connect it to publish data or subscribe to a channel.

A detail of how to use MQTT plus Video instruction can be found at [Example 2: Test with a MQTT IoT Server](#) from user manual

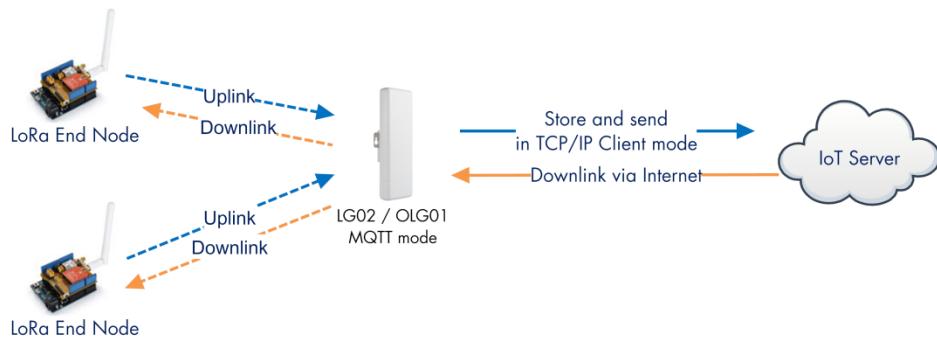

http://www.dragino.com/downloads/index.php?dir=LoRa_IoT_Kit/v2-Kit/ with version higher than v1.0.3

7. Example 4: TCP IP Client Mode

In the TCP IP Client mode, LG01N can accept LoRa packets and send it to the TCP-IP server. The working topology is as below. In this mode, The Uplink LoRa packets should use a customized format.

TCP/IP Client mode:

Use LG02 / OLG02 as a LoRa Gateway to forward packet to IoT Server in TCP/IP Client Mode

Operate Principle:

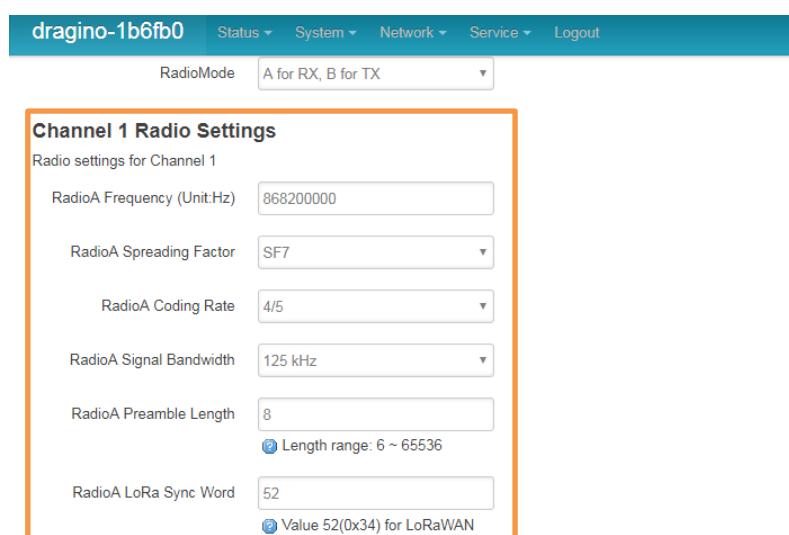

- > The LoRa end node sends data to LG02 gateway via private LoRa protocol. LG02 stores the sensor data.
- > LG02 sends the sensor data to IoT Server via general TCP/IP Client mode.

Step1: Select TCP-IP Client mode

The screenshot shows the IoT Service configuration page. The 'LoRaRAW forward to TCP/UDP' option is selected and highlighted with an orange box. Other options include 'LoRaRAW forward to MQTT' and 'LoRaRAW forward to LoRaWAN'. Below the dropdown is a 'Debug Level' dropdown set to 'Little message output'. At the bottom right are 'Save & Apply' and 'Save' buttons.

Step2: Configure the Radio channel with the match radio settings frequency as the LoRa End Node

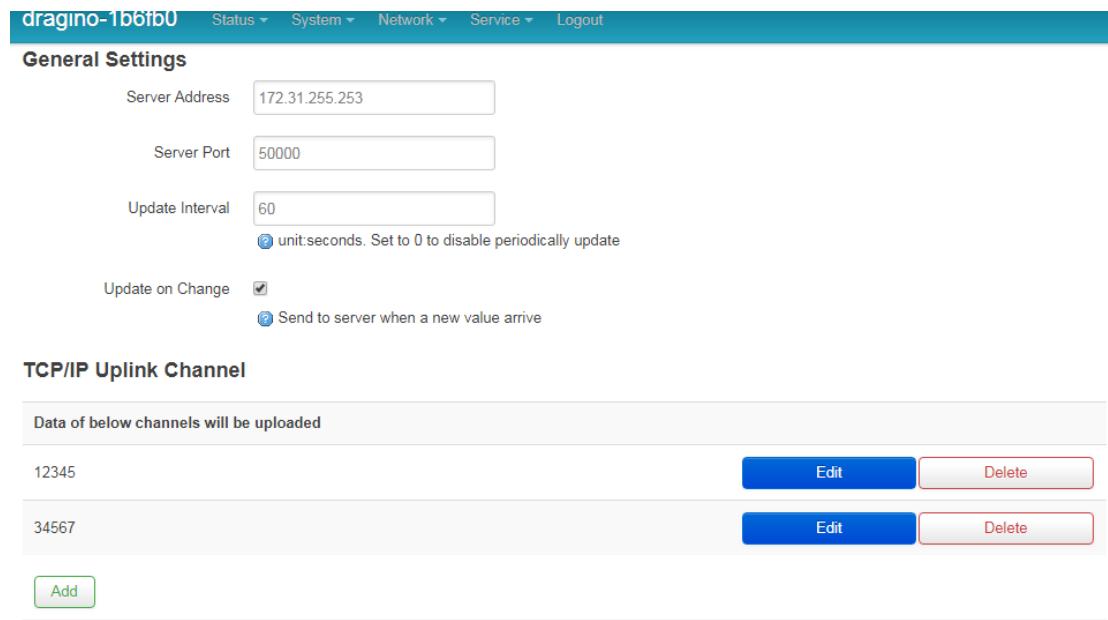

The screenshot shows the Channel 1 Radio Settings configuration page. The entire form is highlighted with an orange box. The settings are as follows:

Channel 1 Radio Settings	
RadioA Frequency (Unit:Hz)	868200000
RadioA Spreading Factor	SF7
RadioA Coding Rate	4/5
RadioA Signal Bandwidth	125 kHz
RadioA Preamble Length	8 <small>Length range: 6 ~ 65536</small>
RadioA LoRa Sync Word	52 <small>Value 52(0x34) for LoRaWAN</small>

Step3: Configure TCP Server Info

Note: Gateway may receive many LoRa packets, it will only transfer the packet with the same ID as specify in the channel.

The screenshot shows the DRAGINO web interface with the following sections:

- General Settings:**
 - Server Address: 172.31.255.253
 - Server Port: 50000
 - Update Interval: 60 (unit: seconds. Set to 0 to disable periodically update)
 - Update on Change: (Send to server when a new value arrive)
- TCP/IP Uplink Channel:**
 - Data of below channels will be uploaded
 - Channels listed: 12345, 34567
 - Buttons: Edit, Delete, Add

Step4: About uplink data format

The LoRa end node should upload the data with below format:

Uplink Format: <Channel_ID>data

For example, if we have configured 2 channels 12345 and 34567.

And there are three LoRa End nodes sending: 12345,34567,78

The LG02 will accept the data from 12345 and 34567, it will ignore the data from Node 78

Case 1:

Node 12345 send <12345>field1=0.0&field2=1102.0

Node 34567 doesn't send anything

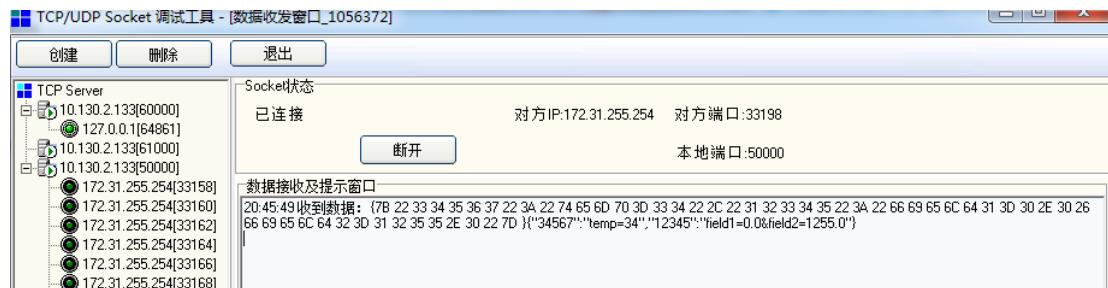

The TCP/IP server will get {"12345":"field1=0.0&field2=1102.0"}

Case 2:

Node 12345 send <12345>field1=0.0&field2=1102.0

Node 34567 send <34567>temp=34

The TCP/IP server will get {"34567":"temp=34","12345":"field1=0.0&field2=1102.0"}

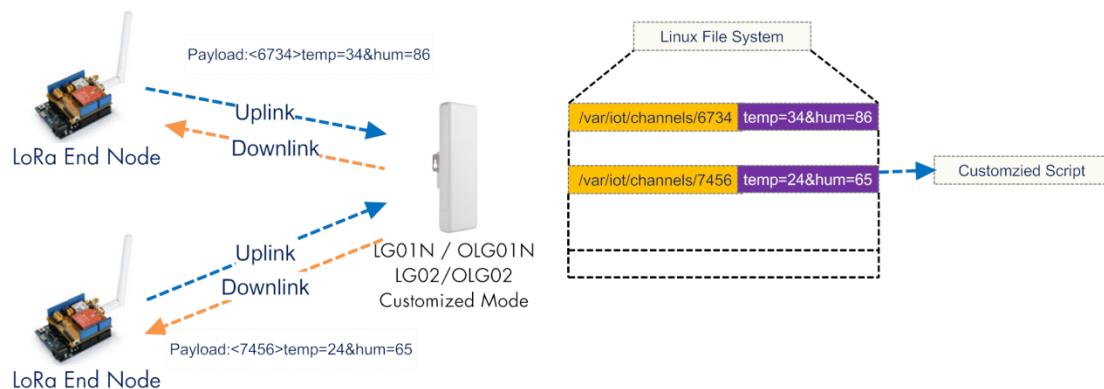

LoRa End Device reference source code: [check this link.](#)

8. Example 5: Write a customized script

LG01N supports customized script to process LoRa data. This chapter describes about the data format from LoRa End node and How to write the script.

The data flow from LoRa End Node to LG01N is as below:

How customized script works:

Operate Principle:

- > LoRa End Node sends the data to gateway in specify format: <node_ID>value
- > Gateway get the data and will put the data in corresponding files under /var/iot/channels.
- > The customized script interact with these channels files. So developer can focus on writing this script.

Example: Store Data in a file.

Step 1: Choose LoRa customized script mode

dragino-1b81c8 Status ▾ System ▾ Network ▾ Service ▾ Logout

LoRa Gateway Settings

Configuration to communicate with LoRa devices and LoRaWAN server

LoRaWAN Server Settings

IoT Service	Process LoRa Data via customiz ▾
Debug Level	Little message output ▾

Step 2: Configure LoRa Frequency

Channel 1 Radio Settings

Radio settings for Channel 1

RadioA Frequency (Unit:Hz)	915600000
RadioA Spreading Factor	SF7
RadioA Coding Rate	4/5

Step 3: Choose the customized script

Customized Script

Run a Customized Script to process LoRa Data, parameters are optional and defined in script

General Settings

Script Name	store_data_to_file.sh
Parameter 1	/var/sensor_data

The directory to store customized script is in [`/etc/lora/customized_scripts/`](#). User can write a new script and put it under this directory for their application. The web will auto detect it.

Step 4: Configure the LoRa End Device to send sensor data.

Here is an example code for LoRa Shield: [End Device Code](#)

Outputs:

End node send out packages:

```
|  
LoRa Sender  
Sending packet: 0  
Sending packet: 1  
Sending packet: 2  
Sending packet: 3  
Sending packet: 4  
Sending packet: 5
```

Gateway receive packet & Script find packet

9. Example 6: Communicate to a HTTP server

Here shows an example for how to communicate to ThingSpeak server via HTTP protocol.

Communicate with thingspeak via HTTP GET/POST:

Operate Principle:

- > LoRa End Node sends the data to gateway in specify format: <node_ID>value
- > Gateway get the data and will put the data in corresponding files under /var/iot/channels.
- > HTTP Process Script will put the data to remote channel according to the pre-configure mapping
- > HTTP Process Script will run curl command to check the talkback command from server. If there is talkback command, it will construct a outgoing file under /var/iot/push for downlink purpose.

9.1 Test uplink and downlink via Linux command

We can see the API requests method in ThingSpeak API keys tab.

dragino-test

Channel ID: 396640
Author: dragino1
Access: Private

Write API Key

Key: P07KVY59P5QEY6M6

Generate New Write API Key

Help

API keys enable you to write data to a channel or read data from a private channel. API keys are auto-generated when you create a new channel.

API Keys Settings

- **Write API Key:** Use this key to write data to a channel. If you feel your key has been compromised, click **Generate New Write API Key**.
- **Read API Keys:** Use this key to allow other people to view your private channel feeds and charts. Click **Generate New Read API Key** to generate an additional read key for the channel.
- **Note:** Use this field to enter information about channel read keys. For example, add notes to keep track of users with access to your channel.

Read API Keys

Key: WJXRTGTMWADPVQNF

Note:

API Requests

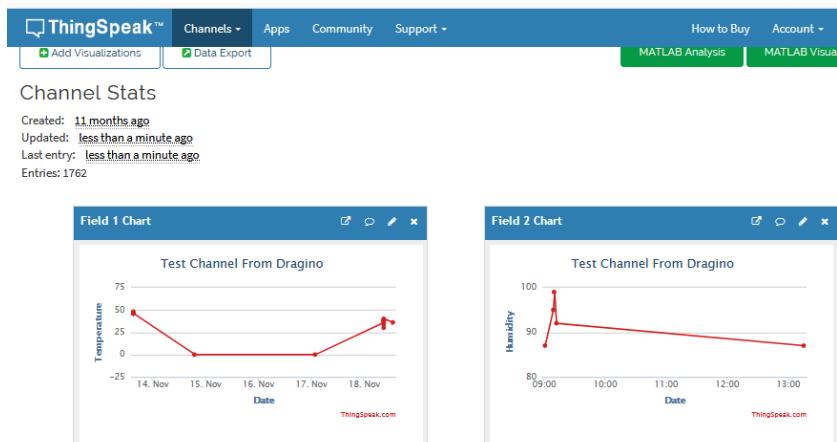

Update a Channel Feed

GET https://api.thingspeak.com/update?api_key=P07KVY59P5QEY6M6&field1=1

Run curl command to use this API (update a channel feed) :

```
172.31.255.254 (1) - SecureCRT
文件(F) 编辑(E) 查看(V) 选项(O) 传输(T) 脚本(S) 工具(L) 帮助(H)
172.31.255.254 (1)
root@dragino-1893c4:~# curl -k --get "https://api.thingspeak.com/update?api_key=P07KVY59P5QEY6M6&field1=35&field2=98"
4310root@dragino-1893c4:~#
```

And we will be able to see the update in the feed:

ThingSpeak has a talkback API which can dispatch command, it is under Apps → Talkback

Apps / TalkBack / test

Edit TalkBack

Name: test
 TalkBack ID: 30660
 API Key: JZ3X4Y9MTCZNH9YO
 Regenerate API Key

Created: 2019-01-30 5:11 am
 Logged to Channel: dragino-test

Help

Example API Endpoints

Add a TalkBack Command
 POST <https://api.thingspeak.com/talkbacks/30660/commands-.json>
 api_key=JZ3X4Y9MTCZNH9YO

Get a TalkBack Command
 GET https://api.thingspeak.com/talkbacks/30660/commands/COMMAND_ID-.json?api_key=JZ

Update a TalkBack Command
 PUT https://api.thingspeak.com/talkbacks/30660/commands/COMMAND_ID-.json
 api_key=JZ3X4Y9MTCZNH9YO

Execute the Next TalkBack Command
 POST <https://api.thingspeak.com/talkbacks/30660/commands/execute.json>
 api_key=JZ3X4Y9MTCZNH9YO

We can use curl command to get command_string, as below:

```
172.31.255.254 (1) - SecureCRT
文件(F) 编辑(E) 查看(V) 选项(O) 传输(T) 脚本(S) 工具(L) 帮助(H)
172.31.255.254 (1)
root@dragino-1893c4:~# curl -k "https://api.thingspeak.com/talkbacks/30660/commands/execute.json" --data "api_key=JZ3X4Y9MTCZNH9YO"
root@dragino-1893c4:~# curl -k "https://api.thingspeak.com/talkbacks/30660/commands/execute.json" --data "api_key=JZ3X4Y9MTCZNH9YO"
{"id":15071098,"command_string":"downlinkcommand","position":null,"executed_at":"2019-01-30T10:22:38Z","created_at":"2019-01-30T10:22:29Z"}root@dragino-1893c4:~#
```

9.2 Test uplink and downlink in LoRa

9.2.1 Set up on gateway

Step1:

Run below commands to download the customized script for ThingSpeak:

```
root@dragino-1893c4:~# wget  
http://www.dragino.com/downloads/downloads/LoRa\_Gateway/LG02-OLG02/Firmware/customized\_script/uplink\_downlink\_ThingSpeak.sh  
root@dragino-1893c4:~# chmod +x uplink_downlink_ThingSpeak.sh  
root@dragino-1893c4:~# mv uplink_downlink_ThingSpeak.sh /etc/lora/customized_scripts/
```

Step2:

Modify the script for your channels:

There are three place need to modify:

1. Replace the channel with the corresponding channel ID and API KEY

```
if [ "$channel" == "396640" ];then  
    WRITE_API_KEY="P07KVY59P5QEY6M6"  
fi
```

- 2.

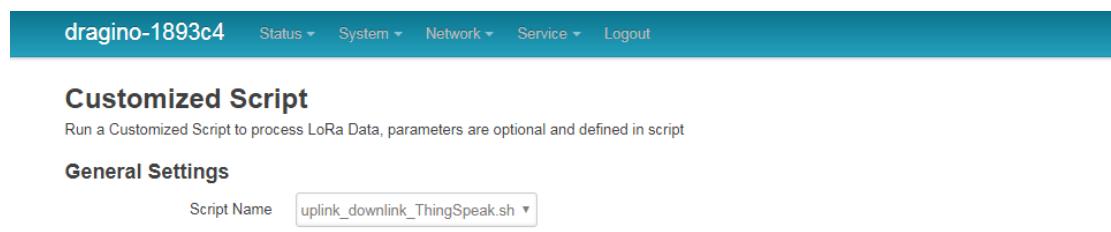

talkback=`curl Replace with the actually talk back URL

3. Modify this line with the suitable frequency.

```
echo "{\"txpk\":{\"freq\":915.0,\"powe\":2
```

Step3:

Select ThingSpeak script as the customized script.

dragino-1893c4 Status ▾ System ▾ Network ▾ Service ▾ Logout

Customized Script

Run a Customized Script to process LoRa Data, parameters are optional and defined in script

General Settings

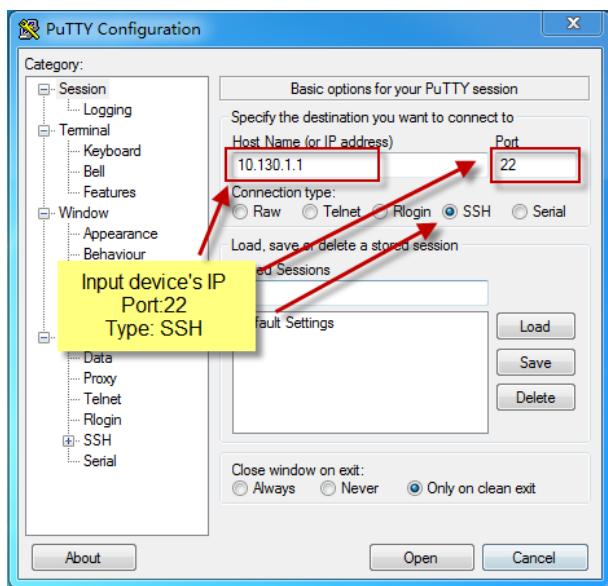

Script Name

10. Linux System

The LG01N bases on OpenWrt Linux System. It is open source, and user are free to configure and modify the inside Linux settings.

10.1 SSH Access for Linux console

User can access to the Linux console via SSH protocol. Make sure your PC and the LG01 is in the same network, then use a SSH tool (such as [putty](#)) to access it. Below are screenshots:

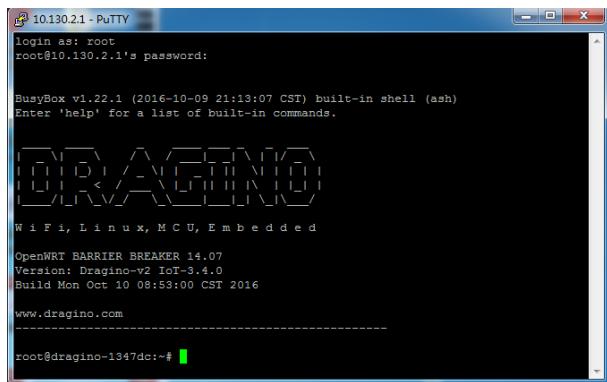

IP address: IP address of LG01N

Port: 22 or 2222

User Name: **root**

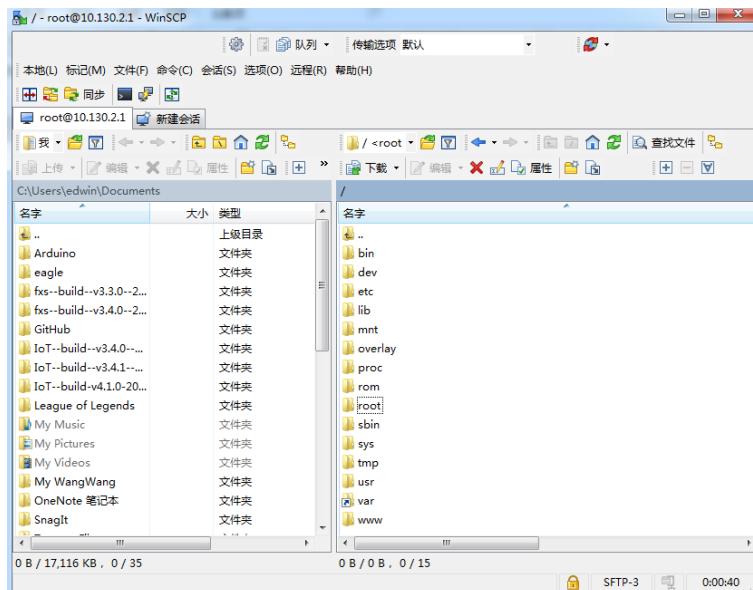

Password: **dragino** (default)

After log in, you will be in the Linux console and type command here.

10.2 Edit and Transfer files

The LG01N support **SCP protocol** and has a built **SFTP server**. There are many ways to edit and transfer files using these two protocols. One of the easiest is through [WinSCP](#) utility. After access via WinSCP to the device, user can use a FTP alike window to drag / drop files to the LG01N or Edit the files directly in the windows. Screenshot is as below:

10.3 File System

The LG01N has a 16MB flash and a 64MB RAM. The /var and /tmp directory are in the RAM, contents stored in /tmp and /var will be erased after reboot the device. Other directories are in the flash and will keep after reboot.

Use cat /proc/mtd to see all blocks/partitions.

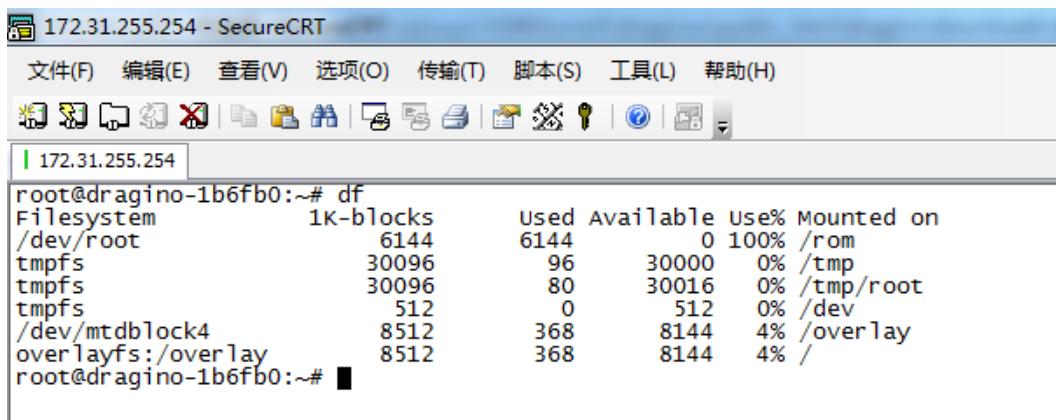

```
172.31.255.254 - SecureCRT
文件(F) 编辑(E) 查看(V) 选项(O) 传输(T) 脚本(S) 工具(L) 帮助(H)

172.31.255.254
root@dragino-1b6fb0:~# cat /proc/mtd
dev:      size  erasesize name
mtd0: 00040000 00010000 "u-boot"
mtd1: 00fa0000 00010000 "firmware"
mtd2: 00160000 00010000 "kernel"
mtd3: 00e40000 00010000 "rootfs"
mtd4: 00850000 00010000 "rootfs_data"
mtd5: 00010000 00010000 "config"
mtd6: 00010000 00010000 "art"
root@dragino-1b6fb0:~#
```

- ✓ "u-boot" // for boot-loader
- ✓ "firmware" // combination of kernel & rootfs
- ✓ "kernel" // Linux kernel
- ✓ "rootfs" // Linux rootfs

- ✓ "rootfs_data" //inside rootfs, all data store here.
- ✓ "config" // a separate partition doesn't include file system
- ✓ "art" // radio data and board ID.

Use df command to see available flash & RAM:

```
172.31.255.254 - SecureCRT
文件(F) 编辑(E) 查看(V) 选项(O) 传输(T) 脚本(S) 工具(L) 帮助(H)
172.31.255.254
root@dragino-1b6fb0:~# df
Filesystem      1K-blocks   Used Available use% Mounted on
/dev/root        6144       6144        0 100% /rom
tmpfs            30096       96    30000    0% /tmp
tmpfs            30096       80    30016    0% /tmp/root
tmpfs             512        0     512    0% /dev
/dev/mtdblock4   8512       368    8144    4% /overlay
overlayfs:/overlay 8512       368    8144    4% /
root@dragino-1b6fb0:~#
```

tmpfs 30096 96 30000 0% /tmp // RAM: reset after reboot,
/dev/mtdblock4 8512 368 8144 4% /overlay //Flash: Remain after reboot

Reset to factory default:

```
mtd erase rootfs_data -r
```

Except /tmp and /var. all data will be store in flash. /tmp and /var are store in RAM

10.4 Package maintain system

LG01N uses [OPKG package maintain system](#). There are more than 3000+ packages available in our package server for user to install for their applications. For example, if user wants to add iperf tool, they can install the related packages and configure LG01N to use iperf

Below is some examples opkgs command, more please refer [OPKG package maintain system](#)

In Linux Console run:

```
root@dragino-169d30:~# opkg update // to get the latest packages list
root@dragino-169d30:~# opkg list //shows the available packages
root@dragino-169d30:~# opkg install iperf // install iperf, it will auto install the required
packages.
root@dragino-169d30:/etc/opkg# opkg install iperf
Installing iperf (2.0.12-1) to root...
Downloading http://downloads.openwrt.org/snapshots/packages/mips_24kc/base/iperf_2.0.12-1_mips_24kc.ipk
Installing uclibcxx (0.2.4-3) to root...
Downloading
http://downloads.openwrt.org/snapshots/packages/mips_24kc/base/uclibcxx_0.2.4-3_mips_24kc.ipk
Configuring uclibcxx.
Configuring iperf.
```

11. Upgrade Linux Firmware

We keep improving the LG01N Linux side firmware for new features, bug fixes. The latest firmware can be found on [LG01N Firmware & release note](#)

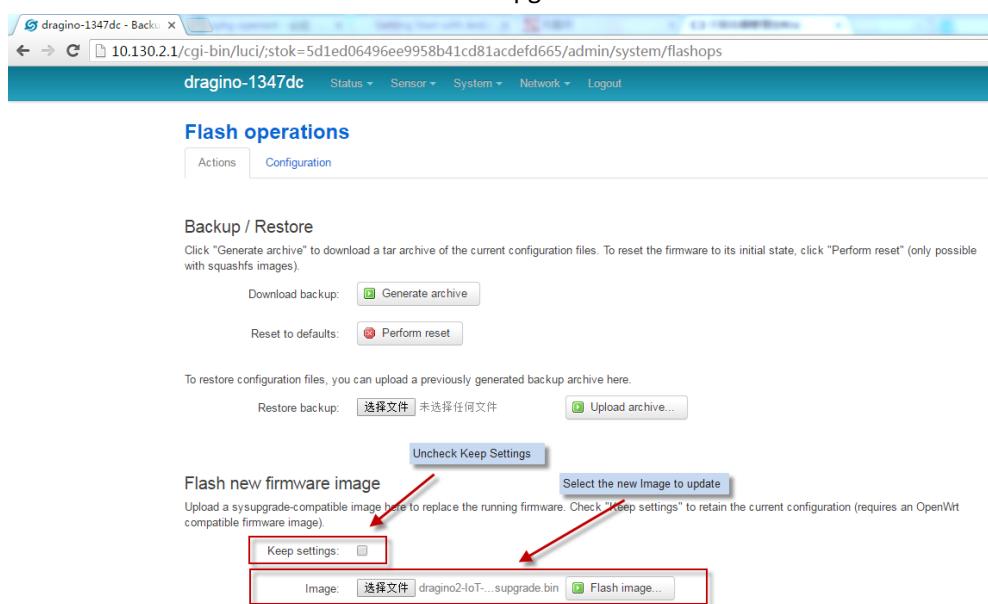

The file named as **dragino-LG02_LG08---xxxxx-squashfs-sysupgrade.bin** is the upgrade Image.

There are different methods to upgrade, as below:

11.1 Upgrade via Web UI

Go to the page: **Web --> System --> Back Up and flash firmware**, Select the image and click Flash Image, the image will be uploaded to the device and then click Process Update to upgrade.

System will auto boot to the new firmware after upgrade.

11.2 Upgrade via Linux console

SCP the firmware to the system **/var** directory and then run

```
root@OpenWrt:~# /sbin/sysupgrade -n /var/Your_Image
```

note: it is important to transfer the image in the /var directory, otherwise it may exceed the flash size.

12. FAQ

12.1 Why there is 433/868/915 version LoRa part?

Different country has different rules for the ISM band for using the LoRa. Although the LoRa chip can support a wide range of Frequency, we provide different version for best tune in the LoRa part. That is why we provide different version of LoRa.

12.2 What is the frequency range of LG01N LoRa part?

The chip used in the LoRa part is:

Version	LoRa IC	Support Frequency	Best Tune Frequency
433	Semtech SX1278	Band2(LF): 410 ~525Mhz	433Mhz
		Band3(LF): 137 ~175Mhz	
868	Semtech SX1276	Band1(HF): 862 ~1020Mhz	868Mhz
915	Semtech SX1276	Band1(HF): 862 ~1020Mhz	915Mhz

User can set the LoRa within above frequency range in the software.

12.3 What does “Limited support on LoRaWAN”?

The base requirement to fully compatible with LoRaWAN protocol requires the gateway support 8 channels. The LG01N only support two channels and can only support limited LoRaWAN protocol.

Because of this limitation, if user wants to use a standard LoRaWAN device with LG01N, user has to modify this LoRaWAN node to run in single frequency to work with LG01N.

For example, in EU868 frequency plan, a standard LoRaWAN node will send the LoRa packet in hoping frequency (normally in 8 different frequencies). So a full compatible LoRaWAN gateway will be able to receive all packets while LG01N will miss 7 packets (according to the current software design, only one rx channel support).

So LG01N is not recommended for high density LoRa deployment or the LoRa Node can't be configured to run in single frequency.

12.4 Can I develop my own LoRa protocol and other software for LG01N?

Yes, the fastest way to develop own software is through the SDK. The instruction is here:

https://github.com/dragino/openwrt_lede-18.06/blob/master/README.md#how-to-develop-a-c-software-before-build-the-image

12.5 Can I make my own firmware for LG01N? Where can I find the source code of LG01N?

Yes, User can make own firmware for LG01N for branding purpose or add customized application.

The LG01N source code and compile instruction can be found at:

https://github.com/dragino/openwrt_lede-18.06

12.6 On OTAA mode, if I use the other frequency, how should I modify in the library?

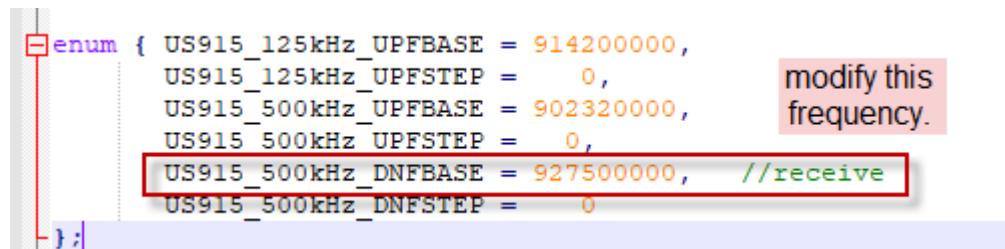

In page [OTAA](#), We use frequency 904.6Mhz for sending. According the LoRaWAN protocol, if the device Join the network successfully, the server will downlink the reply. The different intervals of frequency, the receiving frequency of the end node is also different.

Ex1: We use 914.2Mhz frequency.

We can input the command: logread -f

```

12.7 How can I reset the device to factory default?

User can reset the device to factory default in different ways:

Method 1:

Reset via Web UI. Click the button in Web UI --> System --> Back up / Flash firmware
--> Perform Reset

Method 2:

Reset in Linux console, command is below:

```
root@dragino-1b8288:~# firstboot
```

This will erase all settings and remove any installed packages. Are you sure?

[N/y]

y

/dev/mtdblock4 is mounted as /overlay, only erasing files

```
root@dragino-1b8288:~# reboot
```

12.8 Can I control the LEDs?

Except the PWR LED and sensor LED. All other LEDs can be controlled by developer.

Control Globe LED:

ON: echo 1 > /sys/class/leds/dragino2\:red\:wlan/brightness

OFF: echo 0 > /sys/class/leds/dragino2\:red\:wlan/brightness

12.9 Can I upgrade the LG01-P / LG01-S to LG01-N?

If user has LG01-P / LG01-S, they can upgrade their model to LG01-N by:

- 1) Change the Inside LoRa module to the module used in LG01-N.
- 2) Upgrade the firmware to the LG01-N firmware.

12.10 More FAQs about general LoRa questions

We keep updating more FAQs in our WiKi about some general questions. The link is here:

13. Trouble Shooting

13.1 I get kernel error when install new package, how to fix?

In some case, when install package, it will generate kernel error such as below:

```
root@dragino-16c538:~# opkg install kmod-dragino2-si3217x_3.10.49+0.2-1_ar71xx.ipk
Installing kmod-dragino2-si3217x (3.10.49+0.2-1) to root...
Collected errors:
* satisfy_dependencies_for: Cannot satisfy the following dependencies for
kmod-dragino2-si3217x:
*   kernel (= 3.10.49-1-4917516478a753314254643facdf360a) *
* opkg_install_cmd: Cannot install package kmod-dragino2-si3217x.
```

In this case, user can use the –force-depends option to install such package.

```
opkg install kmod-dragino2-si3217x_3.10.49+0.2-1_ar71xx.ipk --force-depends
```

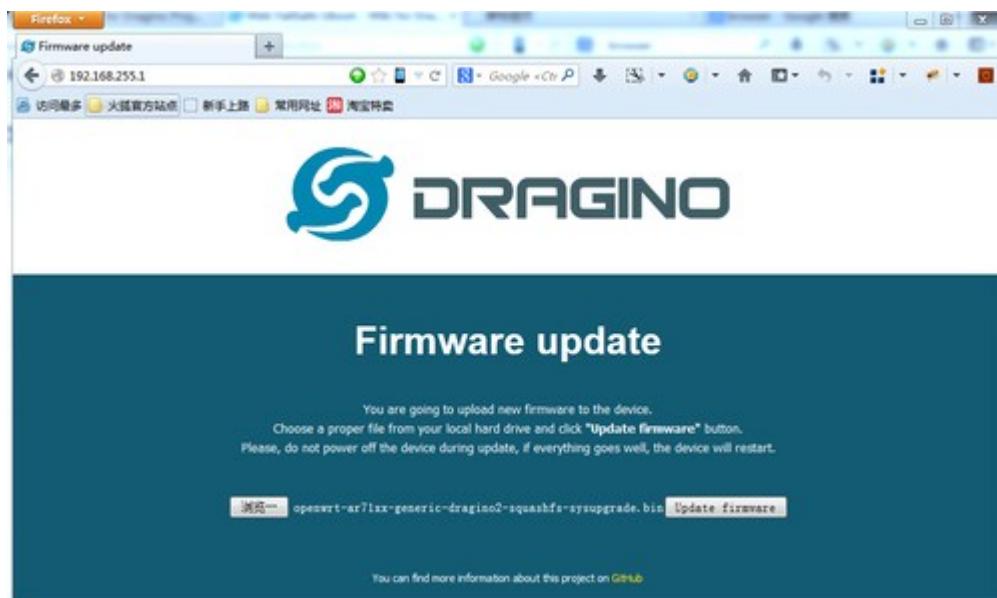

13.2 How to recover the LG01N if firmware crash

LG01N provides user a full control on its Linux system, it is possible that the device will brick and can't boot after improper modification in some booting files.

In this case, user can recover the whole Linux system by uploading a new firmware via Web Failsafe mode.

Procedure is as below:

1. Use a RJ45 cable to connect the PC to LG01N's LAN port directly.
2. Set the PC to ip 192.168.255.x, netmask 255.255.255.0
3. Pressing the toggle button and power on the device
4. All LEDs of the device will blink, release the toggle button after four blinks
5. All LEDs will then blink very fast once, this means device detect a network connection and enter into the web-failsafe mode. Your PC should be able to ping 192.168.255.1 after device enter this mode.
6. Open 192.168.255.1 in web browser
7. Select a squashfs-sysupgrade type firmware and update firmware.

Note: If user sees all LEDs blink very fast in Step 5. This means the network connection is established. If in this case, PC still not able to see the web page, user can check:

- ✓ Try different browser.
- ✓ Check if your PC is in 192.168.255.x
- ✓ Check if you have connected two RJ45 cable to device, If so, remove the unused one

13.3 I configured LG01N for WiFi access and lost its IP. What to do now?

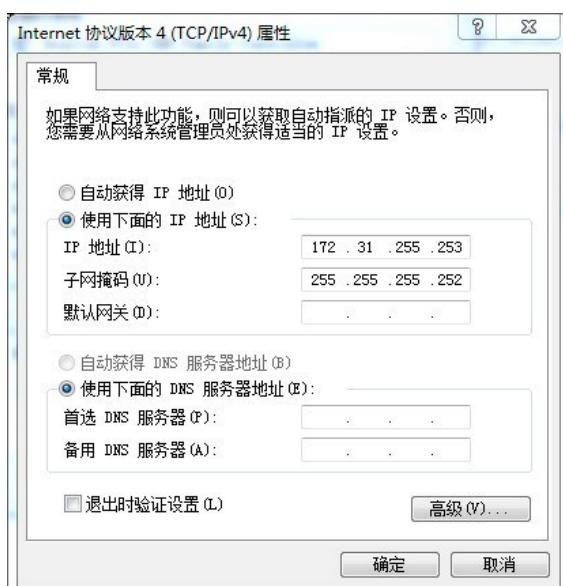

The LG01 has a fall-back ip in its LAN port. This IP is always enabled so user can use fall back ip to access LG01N no matter what the WiFi IP is. The fall back ip is useful for connect and debug the unit.

(Note: fallback ip can be disabled in the LAN and DHCP page)

Steps to connect via fall back IP:

1. Connect PC's Ethernet port to LG01's LAN port
2. Configure PC's Ethernet port has IP: 172.31.255.253 and netmask: 255.255.255.252

As below photo:

3. In PC, use 172.31.255.254 to access LG01 via Web or Console.

14. Order Info

PART: LG01N-XXX-YYY:

XXX: Frequency Band

- **433**: LoRa Gateway best tune to 433 MHz.
- **868**: LoRa Gateway best tuned to 868 MHz.
- **915**: LoRa Gateway best tuned to 915 MHz

YYY: 4G Cellular Option

- **EC25-E**: EMEA, Korea, Thailand, India.
- **EC25-A**: North America/ Rogers/AT&T/T-Mobile.
- **EC25-AU**: Latin America, New Zealand, Taiwan
- **EC25-J**: Japan, DOCOMO/SoftBank/ KDDI

More info about valid bands, please see [EC25-E product page](#).

15. Packing Info

Package Includes:

- ✓ LG01N or OLG01N LoRa Gateway x 1
- ✓ Stick Antenna for LoRa RF part. Frequency is one of 433 or 868 or 915Mhz depends the model ordered
- ✓ Power Adapter: EU/AU/US type power adapter depends on country to be used
- ✓ Packaging with environmental protection paper box

Dimension and weight:

- ✓ Device Size: 12 x 8.5 x 3 cm
- ✓ Device Weight: 150g
- ✓ Package Size / pcs : 21.5 x 10 x 5 cm
- ✓ Weight / pcs : 360g
- ✓ Carton dimension: 45 x 31 x 34 cm. 36pcs per carton
- ✓ Weight / carton : 12.5 kg

16. Support

- Try to see if your questions already answered in the [wiki](#).
- Support is provided Monday to Friday, from 09:00 to 18:00 GMT+8. Due to different timezones we cannot offer live support. However, your questions will be answered as soon as possible in the before-mentioned schedule.
- Provide as much information as possible regarding your enquiry (product models, accurately describe your problem and steps to replicate it etc) and send a mail to

support@dragino.com
